Ashesi University 2022-2023 Academic Catalog

ACADEMIC PROGRAMS, DEGREES AND DEGREE REQUIREMENTS

Mission & Vision Statements

The mission of Ashesi University is to educate a new generation of ethical, entrepreneurial leaders in Africa; to cultivate within our students the critical thinking skills, the concern for others and the courage it will take to transform a continent.

Our vision is an African renaissance driven by a new generation of ethical, entrepreneurial leaders. We aim to educate such leaders, and to drive a movement in African higher education to scale up the education of such leaders.

Academic Message

An Ashesi student's academic purpose is striving for excellence in citizenship, leadership, and scholarship to transform Africa.

Ashesi University Academic and Social Honor Codes

Academic Honor Code (2007): All members of each second-year class at Ashesi University vote on whether to pledge to abide by the Academic Honor Code or not. When a minimum of 66.7% of the class vote in favor of the pledge, the entire class is deemed committed to honoring the pledge, which simply states, "I will not cheat, and I will not allow my peers to cheat".

Social Honor Code (2018): Under the **code**, all members of the **Ashesi** community will now sign on to a new **pledge** of behavior, the **pledge** reads, "as a member of the **Ashesi** Community, I will act with honesty, integrity, and respect for others, and will hold my peers accountable to abide by these principles and by the **university's code** of conduct."

Undergraduate Degrees offered

Bachelor of Science (BSc.)

Department of Business Administration

BSc. in Business Administration

Department of Computer Science and Information Systems

BSc. in Computer Science

BSc. in Management Information Systems

Department of Engineering

BSc. in Computer Engineering

BSc. in Electrical & Electronic Engineering

BSc. in Mechanical Engineering

Graduate Degrees Offered

MSc. in Mechatronic Engineering MAS in Mechatronic Engineering MPhil. in Mechatronic Engineering

Bachelor's Degree Requirements

Ashesi University offers an academic program consisting of a minimum of 134 semester hours (33.5 semester units) of credit for the bachelor's degree. The degree consists of a hybrid of foundational liberal arts core concentrated in year one, a professional core in a major, and elective courses.

Four-Year Curriculum

Ashesi's academic calendar of 32 weeks a year is divided into two semesters, e.g., 16 weeks each, or 15 and 17 weeks, or 14 and 18 weeks. Post-COVID variations in the year one calendar have occurred to respond to the schedule of the national university entrance examinations. Students typically take four semester units per semester. A semester unit for a 16-week semester is 42 (3 hrs. X 14 weeks) classroom contact hours and a range of 14 discussion hours to 42 lab contact hours.

In European Credit Transfer and Accumulation System, ECTS, (using 1 ECTS = 25 hours) each of our degree programs is approximately 240 ECTS. (See page 75)

To earn a baccalaureate degree and be eligible for graduation, students are required to fulfil the following minimal requirements.

- Successful completion of at least 33.5 semester units, including all core and major requirements*
- A cumulative grade point average of 2.0 (C average) or higher
- Successful completion of the service-learning component**
- Successful completion of internship (required only for engineering students) ***
- Successful completion of writing across the curriculum course series (required pass for class of 2024 and subsequent classes) ****
- Fulfilment of all financial obligations to the University.
 - * Note that some Ashesi degree programs require more than **33.5** units, depending on a student's math track.
 - **The **service-learning** component exists as another dimension of our commitment to nurture graduates who excel in citizenship. Service learning helps students develop a sense of citizenship by giving them an opportunity to become engaged with their surrounding community. Students must complete 40 hours of community service and fulfil this requirement in a variety of ways. The Outreach and Experiential Learning Programs office keeps a directory of non-profit organizations students can volunteer with.
 - *** All Ashesi students are strongly encouraged to take up summer **internship** opportunities at the end of their second and third years. To ensure some level of familiarity with the practicing engineering profession, all Ashesi engineering students are required to either: do an internship at an engineering firm or an engineering-related internship at a non-engineering firm; shadow a practicing engineer; or engage in an engineering project for an external company.
 - **** Beginning with the Class of 2024 all Ashesi students should obtain a pass in the Writing Across the Curriculum Lab series as a graduation requirement.

Graduation Honors

Students who earn a cumulative GPA of 3.50 to 3.69 for all undergraduate work earn *Cum Laude* (honors). Those with a cumulative GPA of 3.70 to 3.84 for all undergraduate work earn *Magna Cum Laude* (high honors). Students with a cumulative GPA of 3.85 or above for all undergraduate work earn *Summa Cum Laude* (highest honors).

Summa Cum Laude: 3.85-4.00 (Highest Honors)

Magna Cum Laude: 3.70-3.84 (High Honors)

Cum Laude: 3.50-3.69 (Honors)

Bachelor's Degree: 2.00-3.49

Cum Laude and Class Distinctions

		Public University (University o	f
Ashesi University Honors	GPA	Cape Coast Honors)	GPA
Summa Cum Laude (Highest Honors)	3.85-4.00		
Magna Cum Laude (High Honors)	3.70-3.84	First Class	3.60 - 4.00
Cum Laude (Honors)	3.50-3.69	Second Class (Upper)	
			2.95 - 3.59
Bachelor's	2.00-3.49	Second Class (Lower)	2.45 - 2.94
		Third Class	2.00 - 2.44

New 4 Year Curriculum

New 4 Year Curriculum (Class of 2022 - Class of 2023)

Business Administration, Management Information Systems, & Computer Science (Class of 2022)

Semester	Business Administration	Management Information System	Computer Science
Year 1			
	Ashesi Success		
Sem 1	Pre-Calculus I or Calculus I		
Aug - Dec	Written and Oral Communication		
	Foundations Design & Entrepreneurship	1	
	Introduction to Computing and Informat	ion Systems	
	Leadership Seminar 1*

^{*} Half-credit course

¹ Students who wish to study French will take *Beginning French* 1 as their non-major elective in Year 2 Sem 1. To continue with *Beginning French* 2 in Year 2 Sem 2, they will postpone one required course (*Marketing* for BA majors, *Macroeconomics* for MIS majors, and *Finance for Non-Finance Managers* for CS majors) to the summer or to the elective slot in Year 3 Sem 2. They can continue with their study of French by taking *Professional French* 1 and *Professional French* 2 as course overloads in Year 3. Alternatively, they can free up space for French in Year 3 by taking summer courses after Year 2.

² Data Structures counts as a major elective for MIS majors and is encouraged for those who plan to do software development or those entering Year 2 who are still unsure about whether to major in MIS or CS

³ Although Principles of Economics is prescribed for CS majors, Microeconomics can be substituted. As such, Microeconomics is recommended for students entering Year 2 who are still unsure about whether to major in CS or MIS

[†] Students have flexibility in scheduling electives (major and non-major) in Years 3 and 4 but must ensure that they take the total required number of major electives (3 for BA, 2 for MIS & CS) and non-major electives (3, including at least 1 Africana).

DESCRIPTIONS OF COURSES and PREREQUISITES

Business Administration

BUSA 001 Entrepreneurship Universe

Required for Freshman students

Prerequisite: none Offered: Fall

Course Type: Lecture, Seminar, Experiential

Ashesi Units: 1; Credit Hours: 4; Hours per week classroom: 3; Hours per week discussion: 1 Hours of Study

outside of the class (reading, assignments, studying, projects, and so on: 8 per week)

Entrepreneurship Universe is a four-week introductory overview of the entrepreneurial discipline. The module will take students on an exciting journey of understanding and connecting dots in selected domains of entrepreneurship as deemed relevant. Specific aspects to be covered will include definition and evolution of entrepreneurship, the role of entrepreneurship in economic development, forms of entrepreneurial endeavors, myths of entrepreneurship, key characteristics of entrepreneurs, what the entrepreneurship process entails within and outside our context, among others.

BUSA 100 Principles of Economics

Required for all CS & ENG majors

Prerequisite: Pre-Calculus 2 or Calculus 1

Offered: Fall

Course Type: Lecture

Ashesi Units: 1; Credit Hours: 4; Hours per week classroom: 3; Hours per week discussion: 1 Hours of Study

outside of the class (reading, assignments, studying, projects, and so on: 8 per week)

The aim of the course is to introduce students to the fundamental principles, ideas, concepts, and tools of microeconomic and macroeconomic theories. Also, the course focuses on equipping students with economic knowledge relevant in helping them make informed economic decisions and inferences.

This course will introduce students to the principles of microeconomics and macroeconomics. It is aimed at equipping students with economic knowledge relevant in helping them contribute to economic discussions and make better business decisions. The course will also enable students to understand the connection between microeconomics and macroeconomics, and their practical relationships. We will develop economic tools that are necessary for strategic decision making in the business environment. At the end of the course students should have achieved some understanding of and gained competence in using economic ideas, tools, and procedures.

BUSA 132 Organizational Behavior

Required for all BA majors

Prerequisite: None

Offered: Typically taught in Fall

Course Type: Lecture

Ashesi Units: 1; Credit Hours: 4; Hours per week classroom: 3; Hours per week discussion: 1 Hours of Study

outside of the class (reading, assignments, studying, projects, and so on: 8 per week)

How can managers motivate employees to go above the call of duty to get the job done? How can managers be sure their decisions are not biased? What influence tactics can managers use when they do not have formal authority to tell someone what to do? This course will help students understand life in complex organizations by covering topics that span microanalysis dealing with individuals and macro analysis dealing with the organization. The course is managerial in orientation and focuses on the processes necessary to organize, motivate, direct and control people engaged in collective activities. The emphasis is on the development of concepts and strategies that will help students become managers that are more effective. The course uses readings, cases, exercises and

videos to illustrate the conceptual and applied aspects of individual, group and organizational behavior.

BUSA 161/A Foundation of Design & Entrepreneurship I

Required for all Ashesi students

Prerequisite: none Offered: Fall

Course Type: Lecture, Experiential

Ashesi Units: 1; Credit Hours: 4; Hours per week classroom: 3; Hours per week discussion: 1 Hours of Study

outside of the class (reading, assignments, studying, projects, and so on: 8 per week)

This is the first part of a yearlong course on design and entrepreneurship. The goal of the course is to immerse all first-year students of the University, irrespective of major, into the world of design thinking, entrepreneurship and business management. For this semester's work, the course will cover two main aspects: design thinking for problem solving and entrepreneurial opportunity analysis. The two areas will involve students undertaking exercises to help hone their skills in design thinking, conduct business opportunity identification and analysis culminating in business concepts. Students will then develop and validate their business concepts and present them for evaluation. The first half of this semester will look at creativity, design thinking and innovation with the aim of positioning students to develop an innovative posture. Class sessions and activities will see students uncovering how the brain creates and prevents creativity, how to reframe problems, conduct research, conduct sensemaking to uncover insights from research, develop a point of view, ideate, prototype and develop solutions to the problems identified. The key focus areas are teaching them how to deal with ambiguity and be innovative and creative, in the midst of limitations and constraints. Students will also learn how to prototype and test their ideas with users. The second half of the semester will be structured to help students evaluate their design proposals and decide on how to take them further. Building on the background from the design module, students will study business opportunity analysis and business model development as entrepreneurs and intrapreneurs. They will run through the theories of business venture modelling to help them model their business concepts. This will serve as a basis for using tools like the business model canvas, which will require that students identify potential customer segments, develop and test value propositions that address their pain points, problems or needs they discovered in the first part of the course. At the end of the semester, students will reflect on the course, as well as present their business concepts for evaluation and selection for the business simulation project in the second semester.

BUSA 162 Foundation of Design & Entrepreneurship II

Required for all Ashesi students

Prerequisite: FDE 1 Offered: Spring

Course Type: Lecture, Experiential

Ashesi Units: 1; Credit Hours: 4; Hours per week classroom: 3; Hours per week discussion: 1 Hours of Study

outside of the class (reading, assignments, studying, projects, and so on: 8 per week)

This course is a continuation of Foundations of Design and Entrepreneurship (FDE) I and aims to build on the work done through business simulations on the solution concepts developed. The venture teams will start the semester with continued prototyping, developing, and testing their Minimum Viable Products (MVP), launching their venture concept, and running post-launch promotions, all the while learning about the key entrepreneurship concepts that pertain to the various activities performed in this course. However, the venture teams will not be registered legal entities during the period of the class (perhaps afterwards). Hence, we refer to the nature of the business the venture team conducts during the semester as a business simulation. To elaborate on the process, by conducting Customer Discovery, Customer Validation and exploring Customer Creation and Company Building hypothetically, FDE II teams can test and update their business concepts into validated business ideas that can potentially be explored post FDE. The testing process is iterative as teams will need to incorporate new information or pivot based on outcomes from testing in the rather continuous customer development process. Such informed customer discovery, validation and creation activities will reveal the viability of the business concept and therefore help the team determine if a business concept has prospects for company building or not by the end of the semester. The simulation process therefore provides a rigorous experiential learning corridor

through which FDE teams encounter, experience, and process relevant business knowledge for business venturing in entrepreneurship (as well as in intrapreneurship at the corporate level). Towards the end of the semester, students will be guided in determining how they will transition out of the FDE program after two semesters. If they determine that their business venture should go into the Company Building phase, they will have the opportunity to enroll in the student-led Ashesi Start-up Launchpad. If they decide that they are not interested in pursuing the venture, the team will be assisted in exiting the simulation, resolving inventory, and closing the books.

BUSA 210 Financial Accounting

Required for all BA majors

Prerequisite: none Offered: Fall or Summer Course Type: Lecture

Ashesi Units: 1; Credit Hours: 4; Hours per week classroom: 3; Hours per week discussion: 1 Hours of Study

outside of the class (reading, assignments, studying, projects, and so on: 8 per week)

This is an introductory accounting course that exposes students to fundamental accounting principles, the regulatory framework of accounting practice, elements of financial statements, the mechanics of data entry, preparation of financial statements, financial statement analysis, control accounts and reconciliations, and ethics in the accounting profession. The course is designed to provide students with the requisite skills for analyzing transactions, opening, and maintaining proper books of accounts, doing basic reconciliations, preparing financial statements for sole proprietorships, applying fundamental accounting principles and ethical codes in solving accounting and business problems, and evaluating the financial performance of a business entity using financial statement analysis.

BUSA 220 Introduction to Finance

Required for all BA majors

Prerequisite: Financial Accounting

Offered: Spring or Summer Course Type: Lecture

Ashesi Units: 1; Credit Hours: 4; Hours per week classroom: 3; Hours per week discussion: 1 Hours of Study

outside of the class (reading, assignments, studying, projects, and so on: 8 per week)

This is an introductory course aimed at equipping students with the basic skills of corporate finance. In this course, students will be introduced to some fundamental principles of corporate finance such as time value of money and risk. Specific areas of concentration include the time value of money, investment valuation and decision making under conditions of certainty and uncertainty, working capital management, capital budgeting, cost of capital, capital structure and dividend policy, and intermediate and long-term financing.

BUSA 224 Finance for non-Finance

Required for all MIS & CS majors

Prerequisite: Pre-calculus 1 & 2 or Calculus 1; Prior or concurrent enrolment in Microeconomics

Offered: Spring & Summer Course Type: Lecture

Ashesi Units: 1; Credit Hours: 4; Hours per week classroom: 3; Hours per week discussion: 1 Hours of Study

outside of the class (reading, assignments, studying, projects, and so on: 8 per week)

This course is designed to equip students with the necessary tools, skills and competencies required of contemporary managers of top-notch organizations to properly handle financial management and planning issues. It is a platitude that almost every activity in an organization has some monetary implications, hence may translate into numbers. Managers must therefore be trained to know how their actions and inactions affects the numbers, which in turn affect the entity's profitability; a critical ingredient necessary for the long-term survival of

the business. The course is organized under four main thematic areas – understanding the business, tax, and finance environments; understanding financial statements; effective cost management and planning; and effective financial decision-making. Materials for the course will be delivered through lectures and class presentations of relevant cases, which draw on specific concepts discussed to enhance students' understanding.

BUSA 304 Operations Management

Required for all BA majors

Prerequisite: Quantitative Methods or Statistics for Engineering & Economics

Offered: Fall

Course Type: Lecture

Ashesi Units: 1; Credit Hours: 4; Hours per week classroom: 3; Hours per week discussion: 1 Hours of Study

outside of the class (reading, assignments, studying, projects, and so on: 8 per week)

The study of Operations Management this spring semester will take you on a journey of the principles, strategies and tools required to manage any part of an organization that is involved in the provision of goods and or services. The activities involved in the transformation of a need of a product and or service into the actual product or service is an intriguing process which covers a huge part of a typical organization. The transformation process offers a lot of opportunities for achieving competitive advantage and the manager of any part of the process or at any strategic level in an Organization needs to understand how the various processes fit together, what the implications are for the weakest part of the process, identify opportunities for continuous improvement and also see from a bird's eye view, the approach leadership must take to ensure profitability, growth, continuous improvement, development of employees and sustainability. While looking out for all the above factors, there is also the issue of ensuring that the organization, institution, or company is here for the long haul through a consistent review of sustainability requirements.

BUSA 311 Managerial Accounting

Required for all BA & MIS majors

Prerequisite: Financial Accounting or Finance for non-Finance Managers

Offered: Spring or Summer Course Type: Lecture

Ashesi Units: 1; Credit Hours: 4; Hours per week classroom: 3; Hours per week discussion: 1 Hours of Study

outside of the class (reading, assignments, studying, projects, and so on: 8 per week)

Students will learn how to use financial information to identify and analyze alternative projects to be undertaken by the entity to optimize profitability. They will develop the critical analytical skills necessary for identifying and using relevant costs and related issues, which form the bedrock for cost-effective managerial decision making.

BUSA 321 Investments

Required for all BA majors

Prerequisite: Introduction to Finance or Finance for non-Finance Managers

Offered: Fall or Summer Course Type: Lecture

Ashesi Units: 1; Credit Hours: 4; Hours per week classroom: 3; Hours per week discussion: 1 Hours of Study

outside of the class (reading, assignments, studying, projects, and so on: 8 per week)

This course surveys the investment media, concepts, and techniques to provide an understanding of the investment process in the economic and financial environment. The course covers the elements of investments, portfolio theory and management, security analysis, valuation of stocks and bonds, and risk-return trade-off. The course entails only the necessary mathematical and technical details which will provide the intuition that may illuminate the gliding path for students as they confront new ideas and challenges in their later lives as investment practitioners. On the conviction that theories such as the capital asset pricing model and the efficient market hypothesis are intellectually satisfying subjects of scientific research as they are important building blocks for the development of solid grounding in investments, aspects of these theories will be used generously to

determine the value of real and financial assets. As the instructor tries to bridge the gap between theory and practice, several real-world examples are presented. The course will consist of lectures and discussions of contemporary investment and finance challenges and developments in Ghana and across the globe. In particular, students will be exposed to trends in socially responsible investing around the globe and what lessons Ghanaian Fund Managers can take. A good dose of data will be used in the 'analysis' part of the course. Students will be required to use Microsoft Excel analytic tools to solve a large part of the problem sets. This is also intended to provide students with a taste of tools they will need to understand and use in their career as investment analysts.

BUSA 341 Marketing

Required for all BA majors.

Prerequisite: Micro-economics

Offered: Spring Course Type: Lecture

Ashesi Units: 1; Credit Hours: 4; Hours per week classroom: 3; Hours per week discussion: 1. Hours of Study

outside of the class (reading, assignments, studying, projects, and so on: 8 per week)

Marketing is a key driver of success in today's dynamic organizations. This course will give you an insight into marketing concepts and tools and how these are applied to deliver results. The essential or big question this course seeks to answer is "How do organizations, especially private, for-profit enterprises, create value for customers, clients or stakeholders while achieving the objectives of the organizations in a dynamic, digitized business environment?"

Students will be exposed to and given the opportunity to apply foundational knowledge of marketing concepts, principles and skills that thriving firms or organizations use to undertake the following critical marketing tasks:

Understand consumer needs and wants as well as identify opportunities and threats in the marketplace.

Decide which target markets to serve best.

Develop a compelling value proposition by which the firm can grow and win in the marketplace.

Craft an integrated marketing plan to deliver superior value, appeal to customers, build lasting relationships with target customers and deliver sustainable profitable returns to the organization.

Students are expected at the end of the course to demonstrate the strategic marketing management skills of understanding customer preferences, designing relevant products and service value propositions to meet the needs of selected customers, and determining appropriate means of communicating, delivering, and capturing value for customers and the firm respectively.

BUSA 350 International Trade & Policy

Required for all BA majors

Prerequisite: Pre-calculus 1; Micro-economics; Macro-economics; Statistics

Offered: Spring Course Type: Lecture

Ashesi Units: 1; Credit Hours: 4; Hours per week classroom: 3; Hours per week discussion: 1 Hours of Study

outside of the class (reading, assignments, studying, projects, and so on: 8 per week)

The course is designed to introduce students to the main concepts and methods of international trade using applications drawn from the real world. Throughout the course, we would convey the major ideas that have emerged from recent research while emphasizing the continued importance of the old theories. Throughout this course, the objective is to guide students to understand how the evolution of international economic theory has helped shape our understanding of a rapidly changing global economy. Also, how we can use the knowledge about international trade to contribute to the on-going debate about trade protection, free trade, regionalism and trade preferences among other issues.

BUSA 400A_B Thesis 1 & 2

Capstone option for BA, MIS, CS

Prerequisite: 8 Credits in Major Area of Study

Offered: Fall & Spring Course Type: Seminar

Ashesi Units: 1; Credit Hours: 3; Hours per week classroom: 1.5; Hours per week discussion: N/A Hours of Study

outside of the class (reading, assignments, studying, projects, and so on: 10 per week)

Send an e-mail to sagyepong@ashesi.edu.gh if you need further information on the BA Thesis capstone process.

BUSA 401_A Entrepreneurship 1

Capstone option for BA, MIS, CS

Prerequisite: 8 Credits in Major Area of Study

Offered: Fall

Course Type: Seminar, Experiential

Ashesi Units: 1; Credit Hours: 4; Hours per week classroom: 3; Hours per week discussion: 1. Hours of Study

outside of the class (reading, assignments, studying, projects, and so on: 8 per week)

Entrepreneurship has been held by many as the key to development in the underdeveloped world. This is because it holds the potential of aiding problem solving through the development of innovative products and services. These will also help in reducing unemployment by serving as income generation avenues for the youth. If Africa, and indeed other developing economies, can achieve the Sustainable Development Goals (SDG), there will be the need to develop profit generating enterprises as well as social enterprises to serve as the backbone and propellant.

This capstone session, in a bid to further position Ashesi graduates to understand the nuances of start-ups and the entrepreneurial mindset to develop into entrepreneurs and intrapreneurs, integrates the skills and knowledge obtained from courses offered in the past three years of the student's education on campus. It will teach students what a start-up is and make the clear distinction between a start-up and a small business. It will take students through opportunity analysis and the development of sustainable business models using Eric Ries' *Lean StartUp*, Steve Blank's *Customer Development Process* and Alexander Osterwalder's *Business Model Canvas*.

The core teaching philosophy is experiential, learner-centric and inquiry-based to develop the mind-set, reflexes, agility and resilience an entrepreneur needs to search for certainty in the chaotic world of start-ups. This will be achieved with the adoption of several teaching aids and stress on the need to *get out of the classroom* to bring their businesses to life.

BUSA 401_B Entrepreneurship 2

Capstone option for BA, MIS, CS Prerequisite: Entrepreneurship 1

Offered: Spring

Course Type: Seminar, Experiential

Ashesi Units: 1; Credit Hours: 4; Hours per week classroom: 3; Hours per week discussion: 1 Hours of Study

outside of the class (reading, assignments, studying, projects, and so on: 8 per week)

Capstone Entrepreneurship II will aim to aid venture teams validate their business models by undertaking further customer and stakeholder engagements, as well as MVP tests. This will help the teams further validate their product-market fit and gain some early adopters/ earlyvangelists to patronize their products/ services and pay for them. Feedback from these earlyvangelists will inform further iterations and pivots. Venture teams will then be taken through the Customer Creation and Company Building aspects of the Customer Development process. These form the *execution* aspect of the Customer Development process. The student will look at their product/ service positioning considering the market type they are entering, and then plan to launch their venture or its product/ service. Due to time constraints, strategies for reaching mainstream customers and company building, with a focus on structuring fast response departments will be put in place to aid in the executing this business model but will not be executed as a requirement of this session. Specifics include venture ownership, resource

management, operations, and some management and cultural issues.

BUSA 402 Business Law

Required for all BA majors

Prerequisite: none Offered: Fall

Course Type: Lecture, Experiential

Ashesi Units: 1; Credit Hours: 4; Hours per week classroom: 3; Hours per week discussion: 1 Hours of Study

outside of the class (reading, assignments, studying, projects, and so on: 8 per week)

The goal of the course is to familiarize students with the legal environment within which business is conducted in Ghana and Internationally.

It is recognized that students undertaking this course are not being trained to be lawyers. However, the basis of all business activity is underlined by rules and regulations and for that matter, laws.

It is therefore essential that a student of Business Law appreciates rudiments or has a basic understanding of the legal framework governing businesses in Ghana.

BUSA 405 Competitive Strategy

Required for all BA & MIS majors

Prerequisite: Introduction to Finance or Finance for non-Finance Managers; Macroeconomics; Prior or concurrent enrollment in Marketing recommended but not required.

Offered: Spring Course Type: Lecture

Ashesi Units: 1; Credit Hours: 4; Hours per week classroom: 3; Hours per week discussion: 1 Hours of Study

outside of the class (reading, assignments, studying, projects, and so on: 8 per week)

Organizations have always had to find ways of staying in business and more importantly thriving in their chosen markets. This requires the development, implementation and evaluation of business strategy. Competitive Strategy also known as business strategy is designed to establish a profitable and sustainable advantage and position for a business in a preferred marketplace.

Although knowledge from such disciplines as Marketing and Human Resource Management are important in managing a business, this course will focus on the role competition plays in business strategy development and implementation i.e. understanding the organization and competitive environment in which a firm operates, formulating long-term direction, determining how to position a business unit, as well create a sustainable competitive advantage within a competitive environment, mobilizing resources and developing capabilities to compete and assessing performance.

BUSA 410 Applied Project

Capstone option for BA, MIS, CS

Prerequisite: 8 Credits in Major Area of Study

Offered: Fall & Spring Course Type: Seminar

Ashesi Units: 1; Credit Hours:3; Hours per week classroom: 1.5; Hours per week discussion: n/a Hours of Study

outside of the class (reading, assignments, studying, projects, and so on: 10 per week)

The Applied Project is characterized by its engagement with a real-life organization. Ultimately, students are expected to integrate foundational knowledge and skills gained over time and use them to solve real-life challenges for existing organizations. The successful execution of an Applied Project requires skills sets including research and critical analysis; stakeholder engagement; project management; professionalism and communication.

The student must be committed to the three pillars of Ashesi, and as a true **scholar**, be able to apply rigorous

research and analytical skills to a real-life challenge; as a **leader**, be able to demonstrate excellent self-leadership and problem-solving skills, all executed in a professional manner; as a good **citizen**, seek to help an organization to create value and contribute to the body of knowledge on the selected subject matter. Click here to view the applied project handbook. Send an email to sagyepong@ashesi.edu.gh if you have any questions about the BA Applied Project.

BUSA 422 Corporate Finance

Required for all BA majors

Prerequisite: Investments Offered: Spring & Summer

Course Type: Lecture

Ashesi Units: 1; Credit Hours: 4; Hours per week classroom: 3; Hours per week discussion: 1 Hours of Study

outside of the class (reading, assignments, studying, projects, and so on: 8 per week)

This course covers numerous issues of practical relevance to the contemporary corporate finance manager. Although the central focus will be on how corporations make investment and financing decisions, the introductory classes will discuss households' saving and investment decision-making and how securities markets and financial intermediaries complement such efforts. Topics to be covered include risk and return, asset valuation, working capital management, mergers and acquisitions, and corporate restructuring. The course focuses on the application of corporate finance concepts to solving real life problems in a typical business environment. Students will learn to appreciate how the timing of and uncertainty about future cash flows and their associated risks combine to determine the current value of those cash flows. It is expected that assignments, class projects, and discussions will provide the needed motivation and enhance students' understanding of the finance theories to be discussed. The numerous real-life examples and cases are aimed at equipping the students with skills to plug-and-play in a starting finance position in any organization in Ghana and abroad.

BUSA 423 International Finance

Major Elective for BA, MIS. Non-Major Elective for ENG and CS

Prerequisite: Introduction to Finance Offered: Typically offered in the Spring Course Type: Lecture, Experiential

Ashesi Units: 1; Credit Hours: 4; Hours per week classroom: 3; Hours per week discussion: 1 Hours of Study

outside of the class (reading, assignments, studying, projects, and so on: 8 per week)

This is an introductory course aimed at equipping students with the basic skills of corporate finance. In this course, students will be introduced to some fundamental principles of corporate finance such as time value of money and risk. Specific areas of concentration include the time value of money, investment valuation and decision making under conditions of certainty and uncertainty, working capital management, capital budgeting, cost of capital, capital structure and dividend policy, and intermediate and long-term financing.

BUSA 430 Human Resource Management

Major Elective for BA, MIS. Non-Major Elective for ENG and CS Prerequisite: Organizational behavior

Offered: Typically offered in the Fall

Course Type: Lecture

Ashesi Units: 1; Credit Hours: 4; Hours per week classroom: 3; Hours per week discussion: 1 Hours of Study

outside of the class (reading, assignments, studying, projects, and so on: 8 per week)

The purpose of this course is to familiarize you with the basic principles and techniques of human resource management. The course takes a practical view that incorporates the contributions of the behavioral sciences with the technical aspects of implementing the HR function in the 'real world.'

Surely, not everyone who takes this course will become a human resource professional, although that individual will learn a great deal about those roles. However, all managers, no matter what their specializations are, play essential roles in carrying out HR policies and practices in their organizations. Consequently, a basic understanding of human resource management (HRM) is essential wherever you find yourself in your world of work. The key

objective of this course is to enable you learn that HRM is more than just accepting employment applications and keeping records. It is a central and strategic organizational activity of increasing complexity and importance.

BUSA 431 Real Estate Development

Major Elective for BA, MIS. Non-Major Elective for ENG and CS

Prerequisite: Quantitative Methods or Statistics for Engineering & Economics

Offered: Typically offered in the Fall Course Type: Lecture, Experiential

Ashesi Units: 1; Credit Hours: 4; Hours per week classroom: 3; Hours per week discussion: 1 Hours of Study

outside of the class (reading, assignments, studying, projects, and so on: 8 per week)

The real estate development course aims to introduce students to what real estate development (RED) is and what the development process entails. It seeks to provide students with a good overview of what goes into the various stages of the development process with emphasis on feasibility studies, financing and management. This year, the class will undertake a feasibility study for a real-life client. This client needs a feasibility study conducted for a development they want to embark on. The outputs expected are a feasibility report and recommendations for financing and property management, post development. Students in the class will be split into teams to conduct the study, going through the 8-stages of the development process. They will do this as they are taken through the various stages of the development process in the class, visit the site and also interact with professionals who will help them make development and investment decisions for the client. The bottom line is a development which is sustainable where its financial model is concerned, and one that is environmentally considerate.

BUSA 442 Strategic Brand Management

Major Elective for BA, MIS. Non-Major Elective for ENG and CS

Prerequisite: Marketing and Text & Meaning; or Foundations of Design & Entrepreneurship II Offered: Typically

offered in the Fall Course Type: Lecture

Ashesi Units: 1; Credit Hours: 4; Hours per week classroom: 3; Hours per week discussion: 1 Hours of Study

outside of the class (reading, assignments, studying, projects, and so on: 8 per week)

The course is designed to develop students' marketing skills and understanding of brand management. In this course, you will learn how to make branding decisions, develop a strategic brand plan & manage brands by learning & applying relevant concepts, principles, & theories. By the end of this course, you should be able to:

- Understand the strategic brand management process and role of brand management in achieving business success.
- Have an in-depth appreciation and understanding of the important issues in planning, implementing and evaluating brand strategies.
- Grasp appropriate concepts, theories, models and other tools to make better branding decisions.
- Apply branding principles to cases and opportunities created by the course.
- Develop brand positioning, strategic brand plans and integrated marketing communications plans to grow brands.

BUSA 444 Supply Chain Management

Major Elective for BA, MIS. Non-Major Elective for ENG and CS

Prerequisite: Quantitative Methods; or Statistics for Engineering & Principles of Economics

Offered: Typically offered in the Fall

Course Type: Lecture

Ashesi Units: 1; Credit Hours: 4; Hours per week classroom: 3; Hours per week discussion: 1 Hours of Study

outside of the class (reading, assignments, studying, projects, and so on: 8 per week)

This course presents the fundamental concepts and tools needed to understand how Supply Chains work. The content spans the typical scope of supply chains: Plan, Source, Make, Deliver and Sell set in today's global market

in which there is fierce competition, more frequent innovation and more sophisticated and demanding customers/consumers. Continuous advances in technology also provide a wide variety of continuous improvement options in supply chains. The interactions of the factors and levels of supply chains are explored for optimization and efficiency in Supply Management, Inventory Management, Product & Production Management, Distribution and Transportation Management. The Course also covers the Responsible Sourcing and the Key Performance Indices that are used to determine service levels and efficiencies in supply chains.

BUSA 451 Development Economics

Major Elective for BA, MIS. Non-Major Elective for ENG and CS

Prerequisite: Micro-economics or Macro-Economics or Principles of Economics; and Statistics

Offered: Typically offered in the Fall

Course Type: Lecture

Ashesi Units: 1; Credit Hours: 4; Hours per week classroom: 3; Hours per week discussion: 1 Hours of Study

outside of the class (reading, assignments, studying, projects, and so on: 8 per week)

This course discusses the problems of Least Developed Countries (LDCs) and Middle-Income countries (especially in Africa, Asia and Latin America) and their efforts to improve the lives and well-being of their people. It incorporates different aspects of the development process including traditional development topics like economic growth; education; population studies; rural-urban migration and poverty studies as well as less traditional but equally pertinent topics like institutions; competition policy; foreign aid and corruption. The principal objective of the course is to develop the student's ability to master and apply the tools of economic theory and analysis to contemporary challenges in economic development.

ECON 101 Micro-Economics

Required for all BA, MIS Majors. CS & ENG majors can substitute Principles of Economics with this course.

Prerequisite: Pre-Calculus 2 or Calculus 1

Offered: Fall or Summer Course Type: Lecture

Ashesi Units: 1; Credit Hours: 4; Hours per week classroom: 3; Hours per week discussion: 1 Hours of Study

outside of the class (reading, assignments, studying, projects, and so on: 8 per week)

The aim of the course is to introduce students to the fundamental principles, ideas, theories and tools of microeconomic theory. At the end of the course students should have achieved some understanding of and gained competence in using economic ideas, tools and procedures.

ECON 102 Macro-Economics

Required for all BA & MIS majors Prerequisite: Pre-Calculus 2 or Calculus 1

Offered: Spring or Summer

Course Type: Lecture

Ashesi Units: 1; Credit Hours: 4; Hours per week classroom: 3; Hours per week discussion: 1 Hours of Study

outside of the class (reading, assignments, studying, projects, and so on: 8 per week)

This course is an introduction to macroeconomics, with a strong emphasis on policy implications. The course has two objectives. Firstly, it will develop simple models of goods and services, assets, capital and money markets which can be usefully applied to generate realistic predictions regarding the behavior of macroeconomic variables such as: output; employment; inflation; the current account; and interest and exchange rates. Secondly, the course will teach students to use these models to understand and interpret current and historical macroeconomic developments. Current macroeconomic developments and policy changes such as the financial and banking crisis, inflation targeting, austerity measures, deficit financing among others will be discussed.

ECON 452 Econometrics

Major Elective for BA, MIS. Non-Major Elective for ENG and CS

Prerequisite: Micro-economics or Macro-Economics or Principles of Economics; and Statistics and Quantitative

Methods (Multi Variable Calculus can replace Quant Methods as a prerequisite for this class)

Offered: Typically offered in the Fall

Course Type: Lecture

Ashesi Units: 1; Credit Hours: 4; Hours per week classroom: 3; Hours per week discussion: 1 Hours of Study

outside of the class (reading, assignments, studying, projects, and so on: 8 per week)

The objectives of the course are the following:

• Introduce students to techniques for performing statistical analysis on quantitative data focusing on the estimation of the regression model.

- Help students solve problems commonly encountered in estimating statistical models like the regression model.
- Teach students to interpret the estimates from such models.
- Enable students to be able to perform quantitative analysis using secondary data.

Please note: The course is ideal for current Ashesi seniors and juniors interested in the analysis of quantitative (as opposed to qualitative) data.

ECON 455 Managerial Economics

Major Elective for BA, MIS. Non-Major Elective for ENG and CS

Prerequisite: Calculus 2 or Applied Calculus; Micro-economics; Macro-economics; Statistics or

Econometrics

Offered: Typically offered in the Spring

Course Type: Lecture

Ashesi Units: 1; Credit Hours: 4; Hours per week classroom: 3; Hours per week discussion: 1 Hours of Study

outside of the class (reading, assignments, studying, projects, and so on: 8 per week)

Managerial Economics is the study of the different ways in which economic principles and quantitative tools can be employed to assist managers to make effective decisions. It provides principles to foster the goals of the organization, as well as a better understanding of the external business environment in which an organization operates. The course enhances students' understanding of how markets operate and develops their capability to make economic predictions about market outcomes.

ENGR 413 Project Management & Professional Practice

Major Elective for BA, MIS. Non-Major Elective for ENG and CS

Prerequisite: Operations Management Offered: Typically offered in the Fall

Course Type: Lecture

Ashesi Units: 1; Credit Hours: 4; Hours per week classroom: 3; Hours per week discussion: 1 Hours of Study

outside of the class (reading, assignments, studying, projects, and so on: 8 per week)

This course will expose students to planning, strategizing and executing a project in their field of study or in another field, while engaging the cross section of talent in the class: engineering, computer science, management information systems and business administration students. It will develop students' skills to manage projects and build on leadership skills and ethical reasoning they have acquired in core courses. Students will learn about organizational, environmental, safety and health issues that must be considered during the implementation of a project. Students will also learn, discuss, and reflect on professional issues such as social responsibility, ethics, licensing, and regulatory reporting. They will be introduced to Industrial Engineering, process management, work measurement, capacity utilization and constraints management. Hinged on the PMI® Framework for Project Management and using the PMBOK® Guide as the core text, students will network and interact with members of the PMI-Ghana Chapter as they will be recognized as student members for the year. Interested students will also be supported to prep for the CAPM® Certification to enhance their employability after they graduate from Ashesi.

BUSA 424 Venture Capital Investment

Major Elective for BA, MIS. Non-Major Elective for ENG and CS

Prerequisite: TBD

Offered: Typically offered in Fall

Course Type: Lecture

Ashesi Units: 1; Credit Hours: 4; Hours per week classroom: 3; Hours per week discussion: 1 Hours of Study

outside of the class (reading, assignments, studying, projects, and so on: 8 per week)

The course expands on the entrepreneurial skills, cash flow appraisal techniques, investing decisions, and financing decisions learned in the prerequisite courses to the structuring of a venture capital (VC) fund, raising VC funds, appraisal of entrepreneurial ventures, allocation of funds to good entrepreneurial ventures, and support for entrepreneurs through the value generation process to the exit point. Students will learn that VC is not just another financing vehicle, but a business building endeavor pursued by the venture capitalist in strict partnership with the entrepreneur to facilitate and accelerate the success of the entrepreneur. The course asks three pertinent questions: What is an attractive sector to allocate VC funds to? Is the entrepreneurial venture a good one? Will allocation of funds to the entrepreneurial venture allow relevant stakeholders to achieve their return goals? The course will provide students with the knowledge and skills needed to answer those questions through lectures, case studies, testimonials from industry, group discussion, and role play.

BUSA 432 Organization Development

Major Elective for BA, MIS. Non-Major Elective for ENG and CS

Prerequisite: FDE 1 Offered: Spring

Course Type: Lecture, Experiential

Ashesi Units: 1; Credit Hours: 4; Hours per week classroom: 3; Hours per week discussion: 1 Hours of Study

outside of the class (reading, assignments, studying, projects, and so on: 8 per week)

How can the outcome of capstone applied projects help organizations assess themselves and their environments, leading to the revitalization and rebuilding of their strategies, structures and processes for competitive advantage? What influence tactics can student consultants employ to gain trust from organizations for them to open their doors for them to study their systems for improvement? This course is designed to build the capacities of students who desire to undertake capstone applied projects that contribute towards the effectiveness of organizations.

The course is Organization Development (OD) Consulting in orientation, with a focus on the systematic application and transfer of behavioral science knowledge to the planned development, improvement, and reinforcement of the strategies, structures and processes that lead to organizational effectiveness. It pays attention to the practical resolution of organizations' problems systematically under changing environments, organizational behavior which impacts on its development, techniques or tools that use authentic data to identify and address organizations' problems and obstacles that inhibit their growth.

BUSA 441 Service Marketing

Major Elective for BA, MIS. Non-Major Elective for ENG and CS

Prerequisite: Quantitative Methods; or Statistics for Engineering & Principles of Economics

Offered: Typically offered in the Fall

Course Type: Lecture

Ashesi Units: 1; Credit Hours: 4; Hours per week classroom: 3; Hours per week discussion: 1

Hours of Study outside of the class (reading, assignments, studying, projects, and so on: 8 per week)

Growing number of school graduates are recruited in service industries. This is because the service sector as a percentage of Gross National Product is substantial and has grown significantly in most countries including Ghana. However, teaching of Marketing in tertiary institutions tends to focus largely on manufacturing or product-based models of business practice which are not always adequate or even in some cases not very useful in making decisions in a service business. The Services Marketing course seeks to teach students the concepts, frameworks and analytical procedures that are best suited to examine and resolve challenges faced by managers and as well

as develop successful and coherent marketing strategy/plan for service products.

BUSA 471 Social Enterprise

Major Elective for BA, MIS. Non-Major Elective for ENG and CS

Prerequisite: FDE, Micro-Economics

Other courses that complement this course include Marketing; Corporate Finance; Operations Management; Competitive Strategy; Investments; Economic Development; Branding; New Product Development; Strategic Brand

Management; and Service Marketing. Offered: Typically offered in the Spring Course Type: Lecture, Experiential

Ashesi Units: 1; Credit Hours: 4; Hours per week classroom: 3; Hours per week discussion: 1

Hours of Study outside of the class (reading, assignments, studying, projects, and so on: 8 per week)

Social Enterprise is an exploratory business elective offered by the business administration department that challenges the student to think in ways that produce sustainable and profitable outcomes that lead to social or environmental impact. Through various team challenges, assessments, and meet the leader sessions students have the opportunity to discuss, examine, and transfer thought into action as they work together to come up with their own solutions for some of their world's toughest challenges.

Computer Science

CS221 Discrete Structures and Theory

Prerequisites: Pre-Calculus 2 or Calculus 1, Introduction to Computing & Information Systems OR Computer Programming for CS OR Computer Programming for Engineering

Ashesi Units: 1; Credit Hours: 4; Hours per week classroom: 3; Hours per week discussion: 1.5

Hours of Study outside of the class (reading, assignments, studying, projects, and so on:6 - 9 per week)

This course is designed to give students in Computer Science the mathematical foundations they need for their future studies. Specifically, you will learn:

- Mathematical reasoning: how to think logically and mathematically? Understanding and constructing proofs.
- Combinatorial analysis: to be a problem solver, it is important to be able to count objects. We will see some basic techniques for counting.
- Discrete structures: of course, as the name of the course suggests, you will also learn how to manipulate discrete structures (sets, permutations, relations, graphs...).
- Algorithmic thinking: sometimes, we will solve a problem by specifying a list of steps to follow (an algorithm). Algorithms can be implemented through computer programs. By the end of this course, you will know how to describe algorithms (in both English and pseudocode), verify that they work properly, analyze the computer memory and time required to implement them.
- Applications and modeling: applications to show the relevance and practicality of mathematics. We will see applications of discrete mathematics to computer science, data networking and biology. An important problem-solving skill is the construction of mathematical models. We will build our own models while solving some of the exercises.

CS 212 Computer Programming for CS

Prerequisite: Introduction to Computing & Information Systems; Pre-Calculus 1 or Calculus 1 Ashesi Units: 1; Credit Hours: 4; Hours per week classroom: 3; Hours per week lab: 1.5 Hours of Study outside of the class (reading, assignments, studying, projects, and so on: 6 - 9 per week)

This course gives students an intensive introduction to programming as a means of problem solving. It also introduces them to the broader fields of computer science and information systems and shows a connection between computer programming and other disciplines. Concepts will be illustrated in the Python programming language. This course will introduce the object concept, using and declaring functions (methods). Basic software engineering concepts will also be introduced and will be used to solve problems through approximation, simulations, recursive formulas, and data processing.

CS222 Data Structures & Algorithms

Prerequisites: C or better in EITHER Computer Programming for CS OR Computer Programming for Engineering; Concurrent enrolment in Discrete Structures and Theory recommended but not required Ashesi Units: 1; Credit Hours: 4; Hours per week classroom: 3; Hours per week lab: 1.5 Hours of Study outside of the class (reading, assignments, studying, projects, and so on: 6 - 9 per week)

This course is about data structures; that is, the methods of organizing large amounts of data. It is also about algorithm analysis; that is, the estimation of the running time of algorithms. Specifically, this course will cover fundamental abstract data types and their implementations as data structures, such as lists, hash tables, trees and priority queues, as well as asymptotic analyses of algorithms involving these data structures. Students will also learn about recursion, searching (sequential and binary); and sorting (selection sort, insertion sort, merge sort, and heap sort). The Java programming language will be used as the language of implementation in this course.

Course Objectives:

● To be able to analyse and compute the running time of algorithms, expressing these runtimes using asymptotic notation (Big-O)

- To understand and be able to explain, implement and apply fundamental data structures including lists, trees, and hash tables.
- To understand and be able to explain, implement and apply fundamental algorithms for searching and sorting.
- To apply fundamental algorithms and data structures to problem-solving and, by learning good programming and algorithm analysis skills simultaneously, to be able to develop powerful and efficient software programs.

CS 254: Introduction to Artificial Intelligence

Prerequisites: EITHER Computer Programming for CS OR Computer Programming for Engineering; EITHER Discrete Structures and Theory OR Data Structures & Algorithms

Ashesi Units: 1; Credit Hours: 4; Hours per week classroom: 3; Hours per week lab: 1.5

Hours of Study outside of the class (reading, assignments, studying, projects, and so on:6 - 9 per week)

This course introduces the concept of Artificial Intelligence (AI) and gives students the opportunity to explore use cases and applications of AI. It introduces AI concepts and terms such as agents, classical AI, machine learning, deep learning and neural networks. It also introduces various issues and concerns surrounding AI such as ethics and bias, and the future of work. Through hands-on projects with Python, students gain exposure to the theory behind topics in Artificial Intelligence such as graph search algorithms, classification, optimization, reinforcement learning, and machine learning. Students will gain experience using libraries for machine learning and will emerge with knowledge of artificial intelligence principles that enable them to design intelligent systems of their own.

CS313 Intermediate Computer Programming

Prerequisites: EITHER Computer Programming for CS OR Computer Programming for Engineering Ashesi Units: 1; Credit Hours: 4; Hours per week classroom: 3; Hours per week lab: 1.5 Hours of Study outside of the class (reading, assignments, studying, projects, and so on: 6 - 9 per week)

This course is a continuation of Computer Programming for CS and Data Structures & Algorithms. ICP will introduce students to more details of object definition, construction and event driven programming. Here, more emphasis will be placed of Object-Oriented Design (OOD) decisions and also on making efficient system level decisions for data structures. It will also introduce additional standard Java packages, including the file system and graphical user interface elements. The second part of this course will give students an introduction to C++ as well as advanced programming in C++. Good software engineering practices will be featured in various aspects of the course, and notations similar to the Unified Modeling Language (UML) will be employed.

Through one or more team projects, students will gain experience in designing and implementing larger systems. However, the emphasis of the course will be on the use of prewritten packages and built-in language facilities, as well as design and implementation of moderately sized custom classes and algorithms, rather than on the design of whole systems.

CS 314 Human Computer Interaction

Prerequisites: Introduction to Computing & Information Systems OR Computer Programming for CS OR Computer Programming for Engineering

Ashesi Units: 1; Credit Hours: 4; Hours per week classroom: 3; Hours per week lab: 1.5

Hours of Study outside of the class (reading, assignments, studying, projects, and so on: 6 -9 per week)

This course is an introduction to Human Computer Interaction (HCI), a discipline concerned with the design, evaluation, and implementation of interactive computing systems for human use and with the study of major phenomena surrounding them. The course considers the inherently multi- and interdisciplinary nature of HCI and situates various HCI issues in the organizational and societal contexts. It introduces theories of human psychology, principles of computer systems and user interfaces designs, a methodology of developing effective HCI for information systems, and issues involved in using technologies for different purposes.

Learning Objectives: At the end of this course, the student should be able to:

- Explain HCI and interaction design to non-experts
- Describe cognitive foundations of HCI and user centered design process
- Gather and understand user requirements
- Design and evaluate UI of low and medium complexity
- Communicate effectively about design and evaluation
- Discuss some of the outstanding research problems in HCI.

CS331 Computer Organization and Architecture

Prerequisites: EITHER Computer Programming for CS OR Computer Programming for Engineering. Completion or concurrent enrollment in Discrete Structures and Theory.

Ashesi Units: 1; Credit Hours: 4; Hours per week classroom: 3; Hours per week lab: 1.5

Hours of Study outside of the class (reading, assignments, studying, projects, and so on: 6 - 9 per week)

This course presents the fundamental concepts of computer organization and instruction set architectures. Assembly language programming is used to present and illustrate the concepts of instruction set design. The basics of Central Processor Unit (CPU) design and implementation are covered, including some performance enhancing methods like pipelining and memory caches. The interface to the Compiler and Operating System is described in terms of the interaction between the hardware and software components of a system. The course discusses developments in modern computer system such as parallel processing, virtual computing and other new architectures.

Course Objectives:

- Learn digital system design process
- Understanding of modern computer architecture
- Understand Software-Hardware interface
- Understand low level programming and program execution

CS341 Web Technologies

Prerequisites: Computer Programming for CS OR Computer Programming for Engineering, Completion or concurrent enrollment in Database Systems

Ashesi Units: 1; Credit Hours: 4; Hours per week classroom: 3; Hours per week lab: 1.5

Hours of Study outside of the class (reading, assignments, studying, projects, and so on: 6 - 9 per week)

This course will cover the central concepts and technologies related to Web Applications. Topics covered will include basic and advanced HTML, CSS & JavaScript, Server-side programming (using both dominant and modern server-side languages), design and development based on requirement analysis, principles and tools for Web content creation, database fundamentals for the Web, security, content management systems (CMS) and e-commerce basics. The primary goal of this course is to introduce the relevant technologies and skills needed to design, develop, and deploy effective Web Applications.

CS: 361 Introduction to Modelling and Simulation

Pre-requisites: Computer Programming for CS or Computer Programming for Engineering; Calculus 1 or Applied Calculus or Engineering Calculus; Discrete Structures & Theory

Ashesi Units: 0.5; Credit Hours: 2; Hours per week classroom: 1.5; Hours per week lab: 1.5

Hours of Study outside of the class (reading, assignments, studying, projects, and so on: 3 - 5 per week)

Real world systems, such as games, communication networks or transportation systems can be modelled using statistics and a variety of modelling formalisms. This course introduces the process of designing models of existing or proposed real-world systems, and how to use the models to perform simulations that allow for predictions about the future behavior of the system. Programming assignments give the opportunity to construct prototype modelling tools and simulators based on the theory. In addition applications from a variety of domains are used to illustrate the different modelling formalisms.

Course Objectives:

- To understand the principles underlying modelling and simulation
- To be able to apply these principles to model existing or proposed real-world systems
- To use simulation to predict the future behaviour of a system
- To program a prototype simulation based on the underlying theory

CS415 Software Engineering

Prerequisites: EITHER Computer Programming for CS OR Computer Programming for Engineering, EITHER Web Technologies OR Intermediate Computer Programming OR Data Structures

Ashesi Units: 1; Credit Hours: 4; Hours per week classroom: 3; Hours per week lab: 1.5

Hours of Study outside of the class (reading, assignments, studying, projects, and so on:6 - 9 per week)

This course will introduce a collection of methods which embody an "engineering" approach to the development of computer software. The content starts with development lifecycle models, such as waterfall, agile development, etc. and then continues to cover requirements specification, the Unified Modelling Language (UML), software architecture, object-oriented analysis and design, design patterns and testing. Software engineering is an inherently practical subject and applying the concepts being taught is a vital component of developing expertise in this area. Consequently, students undertake a substantial group project, working through a number of stages of the development of a (larger) software application. Students will be supervised but will be expected to largely organize themselves and their work, learning key transferrable skills in management and organisation. Emphasis will be placed on how projects will meet Sustainability Development Goals (SDGs) and pull in Artificial Intelligence to enrich their projects. The course will also serve as an incubator for student ideas.

Course Objectives:

- Appreciate the wider engineering issues that form the background to developing complex and evolving software-intensive systems.
- To understand principles, concepts, methods, and techniques of the software engineering approach to producing quality software.
- To organize and manage a medium-sized software development project, including project plans and documentation, and schedule.
- To make justifiable choices for data structures in projects.
- To make effective technical oral and written presentations.
- Plan and deliver an effective software engineering process, based on knowledge of widely used development lifecycle models.
- Employ group working skills including general organization, planning and time management, and intergroup negotiation.
- Capture, document and analyze requirements.
- Translate a requirements specification into an implementable design, following a structured and organized process.
- Make effective use of UML, along with design strategies such as defining a software architecture, separation of concerns and design patterns.
 - Formulate a testing strategy for a software system, employing techniques such as unit testing, test driven development and functional testing.
- To think critically about ethical and social issues in software engineering.

CS424 Advanced Database Systems

Prerequisites: Database Systems, EITHER Discrete Structures and Theory OR Data Structures and Algorithms Ashesi Units: 1; Credit Hours: 4; Hours per week classroom: 3; Hours per week lab: 1.5 Hours of Study outside of the class (reading, assignments, studying, projects, and so on:6 - 9 per week)

The Advanced Database Systems course deals with the usage as well as concepts of design and architecture of databases. In covering the concepts, theorems and algorithms, proofs relevant to different aspects (design, architecture, and implementation) are covered. The general approach is to go through conceptual and logical database design, architecture (schema, indexes, tuning and storage), core features (transactions, concurrency),

and specialized database usage (datamining & data warehousing). The practical work done in the course goes through usage of some advanced SQL features and the implementation of some algorithms and coding of internals of an actual database system. Students should already know structured query language. Distributed databases, NoSQL, (MongoDB, Firebase, etc.) and graph databases will be covered too.

Course Objectives:

- To be competent with conceptual and logical database design
- To be able to setup and configure Enterprise DBMS: transaction processing, concurrency control, database recovery, security & authorization
- To be able to create and use database objects such as tables, views, stored procedures, functions, indexes, constraints, and triggers
- To be able to design and develop a holistic and efficient database for any system
- To be able to modify data with logical query processing
 To be able to troubleshoot and optimize database using tools to analyze query performance
- To be competent in the use of non-relational databases

CS 434 Parallel and Distributed Computing

Prerequisites: Algorithms Design & Analysis; Computer Organisation and Architecture; Intermediate Computer Programming

Ashesi Units: Ashesi Units: 1; Credit Hours: 4; Hours per week classroom: 3; Hours per week lab: 1.5 Hours of Study outside of the class (reading, assignments, studying, projects, and so on: 6 - 9 per week)

This is an introductory course on developing and implementing efficient algorithms and applications for parallel and distributed systems. Computer systems today generally consist of either a tightly coupled or a loosely coupled network of multi-processors, e.g., MPP, cluster, grid, and peer-to-peer. Learning how to develop and program applications for such systems is a paramount skill for all Computer Scientist. This course will cover various aspects of parallel and distributed computing architectures and efficient algorithm design to harness the multi-processor configurations with emphasis on hands-on programming. It will explore and develop fundamental skills for implementing applications using various facets of networking, parallel and distributed programming techniques.

Topics addressed include but not limited to: Network Interconnects; Shared-memory and Message-Passing Architectures; OpenMP, MPI and Hybrid Computational models; Basic techniques for Parallel/distributed programming and synchronisation; Parallel/distributed algorithms and Applications; Graphics Processing Unit Programming using CUDA; Data Intensive Processing with MapReduce and Parallel I/O techniques.

CS 441 Mobile Application Development

Prerequisites: Web Technologies

Ashesi Units: 1; Credit Hours: 4; Hours per week classroom: 3; Hours per week lab: 1.5

Hours of Study outside of the class (reading, assignments, studying, projects, and so on: 6 - 9 per week

This course introduces the principles of developing interactive mobile applications and services that may be resident on a phone or the web. There will generally be interaction between the client app and the service online. Students will be exposed to a variety of different popular, contemporary or emerging platforms and operating systems, and be sufficiently informed about the different options and capabilities available on these platforms. Students will also be exposed to the features (both hardware and software) and sensors available on mobile devices and will be encouraged to explore their use in building applications and services.

This course requires good programming skills in at least a working knowledge of one language, as well as web development ability. Principal topics include mobile friendly mobile web application development. Client-side application development on platforms which include at the minimum Android will be explored. Contemporary cross platform approaches will also be investigated. Insight into entrepreneurship (building a business around a mobile application) will be provided. Attention will be paid to emerging technologies. The course is very project oriented, as students must receive many hours of hands-on practice and experimentation.

CS435 Operating Systems

Prerequisites: EITHER Computer Programming for CS OR Computer Programming for Engineering, EITHER Discrete Structures and Theory OR Data Structures and Algorithms

Ashesi Units: 1; Credit Hours: 4; Hours per week classroom: 3; Hours per week lab: 1.5

Hours of Study outside of the class (reading, assignments, studying, projects, and so on: 6 -9 per week)

This is a course on theory and practices of operating system design and implementation. Operating Systems are found in most computing devices we use (e.g., mobile phones, tablets, laptops, televisions, cloud); some are embedded, some are general purpose or specialized –anywhere you find computing, you will find an operating system. All operating systems deal in some way or another with users, security, resources, storage and memory, threads and processes, scheduling, as well as policies associated with or built on these. Our course covers an overview of operating systems, processes, memory, I/O management, file systems and some case studies.

Course Objectives: Upon completion of this course, the students should be able to:

- Explain the concepts, structures, and mechanisms of modern operating systems.
- Design a concurrent system without deadlock.
- Write concurrent programs using multiple threads and processes.
- Describe process execution using various CPU scheduling algorithms.

CS 451 Computer Graphics

Pre-requisites: Computer Programming for CS or Computer Programming for Engineering; Linear Algebra or Multivariable Calculus & Linear Algebra; Data Structures and Algorithms or Intermediate Computer Programming; Computer Organization & Architecture (recommended but not required).

Ashesi Units: 1; Credit Hours: 4; Hours per week classroom: 3; Hours per week lab: 1.5

Hours of Study outside of the class (reading, assignments, studying, projects, and so on: 6 - 9 per week)

This is an introductory course in computer graphics, an advanced topic in the field of computer science. Computer graphics are key to many modern software applications. This is not a class in how to use existing graphics-intensive applications (such as Macromedia's Director or Flash, or Alias' Maya or Pixar's Renderman); we will learn the algorithms underlying these tools and the importance of implementing these algorithms for speed. The course introduces the basic concepts of computer graphics, including the theoretical background as well as fundamental algorithms and data structures that are used in today's interactive graphics systems. The course will cover an introduction to 2D and 3D graphics, including scan conversion, anti-aliasing schemes, clipping, OpenGL programming, 3D viewing and transformations, homogeneous coordinates, perspective and orthographic projections, illumination, shading, and some topics needed from linear algebra. The course gives the opportunity for students to develop programming skills in computer graphics through programming assignments.

CS442 E-Commerce

Required for MIS, Elective for CS

Prerequisites: Database Management Systems and Web Technologies

Ashesi Units: 1; Credit Hours: 4; Hours per week classroom: 3; Hours per week lab: 1.5

This is an introduction to e-Commerce principles, technologies, and applications. This course also develops understanding of the problems and requirements of Internet business, and the corresponding solutions. Protocols to ensure secure transactions and e-commerce protocols based on encryption techniques will also be studied. Legal and ethical issues will be discussed, as well as marketing and revenue models for online businesses. Students will get hands on experience building a secure ecommerce site.

Course objectives:

- Students will be able to build an ecommerce application that is secure and uses best practices.
- Students will understand the legal and ethical issues involved in e-commerce.
- Students will understand infrastructure and technology options for setting up an ecommerce site and will have experience deploying some of them.

Students will be able to determine appropriate revenue models for an online business.

CS452 Machine Learning

Prerequisites: Computer Programming for CS OR Computer Programming for Engineering, Multivariable Calculus & Linear Algebra

Ashesi Units: 1; Credit Hours: 4; Hours per week classroom: 3; Hours per week lab: 1.5

Hours of Study outside of the class (reading, assignments, studying, projects, and so on:6 - 9 per week)

Machine learning is the science of getting computers to act without being explicitly programmed. In the past decade, machine learning has given us self-driving cars, practical speech recognition, effective web search, and a vastly improved understanding of the human genome. Many researchers also think it is the best way to make progress towards human-level AI. This course introduces machine learning techniques. Students will learn how the techniques are applied, the mathematical and statistical unpinning of the models and how to explore proper application of the models. Topics include supervised and unsupervised machine learning, statistical inference and prediction. A wide variety of algorithms will be presented, including logistic regression, K-nearest neighbors, na.ve bayes, decision trees, neural networks, k-means, mixtures of Gaussians, principal components analysis, expectation maximization. The course will also discuss modern applications of machine learning such as image segmentation and categorization, speech.

Course Objectives:

- To understand and be able to explain the foundational principles underlying the field of machine learning
- To be able to implement algorithms for regression, classification, clustering and dimensionality reduction
- To be able to design suitable machine learning models for a given real-world problem.
- To be able to read and understand machine learning research papers.
- To be able to give presentations on machine learning work to technical and non-technical audiences.

CS455: Applied Cryptography and Computer Security

Prerequisites: Computer Programming for CS OR Computer Programming for Engineering, Discrete Structures & Theory

Ashesi Units: 1; Credit Hours: 4; Hours per week classroom: 3; Hours per week lab: 1.5

Hours of Study outside of the class (reading, assignments, studying, projects, and so on: 6 - 9 per week)

This course examines the mathematical theory of cryptography and the application of security measures to modern computer systems. Computer Systems Security includes people, hardware, communication, software and data. The course looks at these in the context of Application Security, Web Security, Communication/Networks Security, Operating Systems Security, Database/Data Security, Mobile Systems Security, and Consumer Security (as Social Engineering). Applied Cryptography concerns the underlying mathematical theory of cryptography and its applications. Topics include symmetric encryption, asymmetric encryption (including public key cryptography), and hashing functions and how these are used for authentication, communication/message security, and digital signatures. We will also look at some of the security standards (e.g. AES and DES) and protocols (e.g. IPSec and Kerberos). Laboratory exercises will look at using tools for encryption, creating certificates, public key infrastructure, OS security (e.g. system hardening, firewalls, users access/control/log/audits, intrusion detection), Network/Communication security (e.g. port scanners, spoofing, masquerading, and packet sniffers), web/application security (e.g. buffer overflow, cross-site scripting, and vulnerability scanners), and mobile security (encryption/decryption).

CS458 Internet of Things

Prerequisites: Computer Programming for CS OR Computer Programming for Engineering
Ashesi Units: 1; Credit Hours: 4; Hours per week classroom: 3; Hours per week lab: 1.5
Hours of Study outside of the class (reading, assignments, studying, projects, and so on: 6 - 9 per week)

The Internet of Things (IoT) course takes an end-to-end view of IoT including the devices, networks, data analytics, programming, security, and business. It exposes the student to all aspects of a functional IoT system and how to

design a secure, robust and scalable IoT network, taking on a hands-on approach. Labs and small projects will be used to gain understanding of key concepts at the various layers. Key among these are the devices, network protocols, data and programming aspects. Students will review hardware types and software tools and be introduced to IoT design principles which cover how to transition from an IoT idea to an IoT product, building of prototypes and commercializing them. Since IoT is still emerging, businesses are going to be either adopting IoT solutions or transforming their existing businesses to include IoT in a seamless and sustainable manner. The course addresses these aspects as well, in order to prepare participants to lead in this budding industry in the business segment.

CS459 Natural Language Processing

Prerequisites: Computer Programming for CS OR Computer Programming for Engineering
Ashesi Units: 1; Credit Hours: 4; Hours per week classroom: 3; Hours per week lab: 1.5
Hours of Study outside of the class (reading, assignments, studying, projects, and so on: 6 - 9 per week)

This an introductory course in Natural Language Processing (NLP). NLP is subfield of Artificial Intelligence (AI) concerned with computer's ability to process and generate text in everyday human languages. NLP may also deal with textual content in audios and other modalities. This course will seek to give students a basic understanding of what NLP is and introduce them to some state-of-the art techniques in NLP while stirring their imaginations to harness the power of NLP for African languages.

Course Objective:

- To provide students a basic understanding of NLP
- To introduce students to state-of-the-art techniques in NLP
- To stir students' imagination in harnessing NLP for African languages
- To encourage students to think about and apply NLP in solving local and global problems

CS461 Data Science

Prerequisites: Computer Programming for CS OR Computer Programming for Engineering
Ashesi Units: 1; Credit Hours: 4; Hours per week classroom: 3; Hours per week lab: 1.5
Hours of Study outside of the class (reading, assignments, studying, projects, and so on: 6 - 9 per week)

Data Science is a powerful toolkit for using data to answer questions and guide decision making. It involves skills and knowledge from statistics, software engineering, machine learning, and data engineering. This course is designed for students interested in using a powerful data science toolkit to collect, clean, pre-process, visualize datasets and fit models. It will provide most of the knowledge needed to start applying statistical and machine learning algorithms to projects by combining hands-on practice with the essential theory. In this class, students work on data science projects that involve collecting data or finding data sources, exploratory data analysis and interactive visualization, statistical analysis, predictive analytics, model selection and validation. Course work also involves readings and case studies on ethical practice in data science.

Course Objectives

- As an outcome of this course, students will be able to:
- Collect data from different data sources, clean data and construct data visualization.
- Calculate and interpret basic descriptive statistics.
- Describe and use properties of basic probability distributions.
- Understand and be able to perform statistical inference in the form of confidence
- intervals and hypothesis tests.
- Build different regression models like simple regression, multiple Regression, polynomial regression, ridge regression, the Lasso, and logistic regression.
- Perform linear models' selection.
- Use dimension reduction methods.
- Fit a tree-based models like regression trees, classification trees, bagging, random forests, and boosting
- Divide a dataset into training and test datasets to train and evaluate the performance of different models
- Understand clustering methods like K-Means and Hierarchical clustering.
- Match a statistical and machine learning algorithm to a given dataset.

Communicate a data story both verbally and in written form.

CS462 Cloud Computing

Prerequisites: Database System; Web Technologies and Software Engineeringg Ashesi Units: 1; Credit Hours: 4; Hours per week classroom: 3; Hours per week lab: 1.5 Hours of Study outside of the class (reading, assignments, studying, projects, and so on: 6 - 9 per week)

Computing in the cloud has emerged as a leading paradigm for cost-effective, scalable, well-managed computing. Users pay for services provided in a broadly shared, power efficient datacenter, enabling dynamic computing needs to be met without paying for more than is needed. Actual machines may be virtualized into machine-like services, or more abstract programming platforms, or application specific services, with the cloud computing infrastructure managing sharing, scheduling, reliability, availability, elasticity, privacy, provisioning, and geographic replication. Cloud Computing has transformed the IT industry by opening the possibility for infinite or at least highly elastic scalability in the delivery of enterprise applications as software-as-a-service (SaaS), platform-as-aservice (PaaS) or infrastructure-as-a-service (IaaS). Amazon Elastic Cloud, Microsoft's Azure, Google Cloud, and many other Cloud offerings give software vendors and new start-ups the option to deploy their applications to systems of infinite computational power with practically no initial capital investment and with modest operating costs proportional to the actual use. The course examines the most important APIs used in Google Cloud and Amazon Web Services (and Microsoft Azure), including the techniques for building, deploying, and maintaining machine images and applications. We will learn how to use Cloud as the infrastructure for existing and new services. We will use opensource implementations of highly available clustering computational environments, as well as RESTful Web services, to build powerful and efficient applications. We also learn how to deal with nontrivial issues in the Cloud, such as load balancing, caching, distributed transactions, and identity and authorization management. In the process we will also become very familiar with Linux operating system.

Course Objective:

- Describe, explain, justify, and criticize differing perspectives on the definition, novelty, and essential features of state-of-the-art cloud computing.
- Design and implement distributed systems for big data science applications to operate in and exploit advanced features of cloud computing systems.
- Design, criticize, implement, and improve features of large-scale cluster computing, with emphasis on scale elasticity, limitations on unusually long duration corner cases, high availability in the face of rare and dependent failure modes.
- Interpret and criticize cloud computing research papers and anticipate and design strategies to avert structural or implementation problems identified.

CS463: Computer Vision

Prerequisites: Computer Programming for CS OR Computer Programming for Engineering; Data Structures and Algorithms or Discrete Structures and Theory; Linear Algebra or Multivariable Calculus and Linear Algebra; Statistics with Probability or Statistics for Engineering

Ashesi Units: 1; Credit Hours: ; Hours per week classroom: 3; Hours per week lab: 1.5 Hours of Study outside of the class (reading, assignments, studying, projects, and so on: 6 - 9 per week)

This course introduces computer vision, a subfield of artificial intelligence dealing with how computers gain high-level understanding from digital images or videos. Topics covered include the fundamentals of image formation, camera imaging geometry, feature detection and matching, stereo, motion estimation and tracking, image classification and scene understanding, depth from stereo and motion, camera calibration, object tracking, boundary detection, and object recognition. The focus will be on theory as well as on practice and implementation, using both classical machine learning and deep learning approaches.

Course Objectives

- For students to learn the fundamental theories and techniques of computer vision.
- Describe the scope of challenges and applications addressed by computer vision
- Demonstrate and experiment with image filtering techniques
- Make use of geometric camera models and multiple view geometry
- Undertake video analysis problems such as tracking and structure from motion

- Analyse cognitive tasks including image classification, recognition and detection
- Conduct computer vision experiments and report results systematically

IS333 IT Infrastructure & System Adminstration

Prerequisites: Computer Programming for CS OR Computer Programming for Engineering
Ashesi Units: 1; Credit Hours: 5; Hours per week classroom: 3; Hours per week lab: 3
Hours of Study outside of the class (reading, assignments, studying, projects, and so on: 6 - 9 per week)

This course introduces IT Infrastructure as a shared technology resource for students majoring in Management Information Systems. It covers topics related to both computer and systems architecture and communication networks, with an overall focus on the services and capabilities that IT Infrastructure solutions enable in an organizational context. It gives the students the knowledge and skills that they need for communicating effectively with professionals whose special focus is on hardware and systems software technology and for designing organizational processes and software solutions that require in-depth understanding of the IT Infrastructure capabilities and limitations. The course focuses strongly on Internet-based solutions, computer and network security, business continuity, and the role of Infrastructure in regulatory compliance.

The course builds on this theory with in-depth experience in configuring and administering IT infrastructure, particularly operating systems, networks, network devices, and security solutions. It provides both conceptual knowledge and practical experience. It also prepares the students for organizational roles that require interaction with external vendors of IT infrastructure components and solutions. Topics of discussions, assignments and lecture time shall include, but not limited to server architectures, authentication and security, network services including firewalls, storage services, performance analysis and tuning, management and configuration of services and system resources, system initialization, cross-platform services, policies and procedures.

Course Objectives: Upon completion of this course, the students should be able to.

- Understand the principles underlying layered systems architectures and their application to both computers and networks.
- Understand the differences and similarities between the core elements of an IT Infrastructure solution, such as clients, servers, network devices, wired and wireless network links, systems software, and specialized security devices.
- Understand how IT Infrastructure components are organized into Infrastructure solutions in different organizational environments.
- Understand through practical examples how protocols are used to enable communication between computing devices connected to each other.
- Configure an IT infrastructure solution for a small organization, including a network based on standard technology components, servers, security devices, and several different types of computing clients.
- Identify potential sources of poor computer performance and evaluate potential solutions.
- Evaluate alternative policies and mechanisms for providing reliability features of computer system services and operations.
- Apply the core concepts underlying IP networks to solve simple network design problems, including IP planning.
- Configure simple infrastructure security solutions.
- Negotiate with vendors providing design and implementation solutions.
- Cloud Computing.

IS451 Information and Systems Security

Prerequisites: Discrete Structures; Computer Programming for CS OR Computer Programming for Engineering Ashesi Units: 1; Credit Hours: 4; Hours per week classroom: 3; Hours per week discussion: 1.5 Hours of Study outside of the class (reading, assignments, studying, projects, and so on: 6 - 9 per week)

Information security mechanism is one of the most crucial factors for any organization. Important assets of organization demand a proper risk management and threat model for security hence, information and systems

security concepts are gaining a lot of traction. This course will initially cover the concept of information and systems security and software installations process. It will then move on to modules such as threat modelling, risk management and mitigation.

This Course covers the network as well as web scanning. Later in the course it teaches how to use Kali Linux for ethical hacking, it will have different practical sessions on using Kali Linux such as for information gathering, vulnerability analysis, web application analysis, database assessment and password attacks and have some hands-on experience. It will also cover concepts of incident response system, information rights management and so on. It will then guide you towards building your own information security framework best fit for an organization. At the end of this course, you will be well versed with all the factors involved with information security which would help you build a security framework which will be perfect fit for an organizational requirement.

Mathematics Track

Mathematics courses taken by various majors at Ashesi are housed in the Computer Science Department

MATH101 College Algebra

Prerequisites: None

Ashesi Units: 1; Credit Hours: 4; Hours per week classroom: 3; Hours per week lab: 1

Hours of Study outside of the class (reading, assignments, studying, projects, and so on: 8 per week)

The goal of this course is to help freshmen develop a good knowledge of basic mathematical principles. Because the best way to learn mathematics is to do mathematics, classes will include a lot of meaningful activities through which students will build mathematical intuition, effective problem-solving skills, and discover real-world applications of mathematics.

MATH121 Pre-Calculus 1

Prerequisites: None

Ashesi Units: 1; Credit Hours: 4; Hours per week classroom: 3; Hours per week lab: 1

Hours of Study outside of the class (reading, assignments, studying, projects, and so on: 8 per week)

One definition of mathematics is the science of patterns. Patterns are all around us and the human brain is wired to recognize them. Pre-calculus uses the formal concept of functions to identify and describe patterns found in data, patterns expressed as a formula, and patterns identified visually in a graph. The emphasis of the course is on developing a conceptual understanding of the definition of a function, the characteristics of important function families, connections to real life, and how the study of functions facilitates the understanding of calculus. A focus on problem solving strategies, such as drawing diagrams, systematic lists, looking for patterns, matrix logic, unit analysis, estimation, and others, further develop students' skills in quantitative reasoning.

MATH122 Pre-Calculus 2

Prerequisites: Pre-Calculus 1

Ashesi Units: 1; Credit Hours: 4; Hours per week classroom: 3; Hours per week lab: 1

Hours of Study outside of the class (reading, assignments, studying, projects, and so on: 8 per week)

One definition of mathematics is the science of patterns. Patterns are all around us and the human brain is wired to recognize them. Pre-calculus uses the formal concept of function to identify and describe patterns found in data, patterns expressed as a formula, and patterns identified visually in a graph. The emphasis of the course is on developing a conceptual understanding of the definition of a function, the characteristics of important function families, connections to real life, and how the study of functions facilitates the understanding of calculus. A focus on problem solving strategies, such as drawing diagrams, systematic lists, looking for patterns, matrix logic, unit analysis, estimation, and others, further develop students' skills in quantitative reasoning.

Students Learning outcomes

Mastery of algebra fundamentals.

- Conceptual understanding of functions, including the linear, polynomial, rational, radical, exponential, logarithmic, periodic and related function families, their applications and various forms of representation, such as graphic, symbolic, and tabular forms.
- Ability to apply a problem solving heuristic and appropriate strategies to a wide range of novel and challenging application, logic and quantitative reasoning problems, and present solutions using proper notation and clear communication.

Instructional Objectives

 Content will be presented in a clear and intuitive way using a variety of activities and applications to deepen student understanding and appreciation of functions.

MATH141 Calculus 1

Prerequisites: None

Ashesi Units: 1; Credit Hours: 4; Hours per week classroom: 3; Hours per week lab: 1

Hours of Study outside of the class (reading, assignments, studying, projects, and so on: 8 per week)

This course seeks to equip students with an intuitive idea of limits. We will discuss continuity and the derivative of a function. Rules of differentiation would be examined and applied. The derivative of the elementary and transcendental functions would be discussed. We would apply the taught theoretical concepts to solve real-life problems.

MATH 142 Calculus 2

Prerequisites: Calculus 1

Ashesi Units: 1; Credit Hours: 4; Hours per week classroom: 3; Hours per week lab: 1

Hours of Study outside of the class (reading, assignments, studying, projects, and so on: 8 per week)

In the Business, Science and Engineering settings, quantities such as cost of operation, revenue from sales, profits, distances travelled by automobiles and efficiency of machines are of great importance. However, in most instances such quantities are rarely known. If one has knowledge of their rates of change instead, then one could infer such quantities from their rates of change. Integral calculus is the branch of mathematics that offers a way of obtaining complete knowledge of such unknown quantities from knowledge of their respective rates of change. Understanding key concepts and techniques in Integral Calculus is, therefore, fundamental to obtaining optimal solutions to business as well as scientific problems. This course is designed to equip students with knowledge of Integral Calculus and their application to business and science.

CS 111 Introduction to Computing and Information Systems

Prerequisites: None

Ashesi Units: 1; Credit Hours: 4; Hours per week classroom: 3; Hours per week lab: 1

Hours of Study outside of the class (reading, assignments, studying, projects, and so on: 8 per week)

This course will establish basic information technology literacy, information systems and how they are used in business, including hands-on use of computer applications, principles of digital computers and the internet, data communications and problem-solving through programming. Students will learn how to construct their own websites, develop an on-line presence through LinkedIn, become adept at using Ashesi's computerized course management and grading systems, information systems, business applications, and how to design, construct and use simple databases (SQL Lite). We will use Python (IDE: Thonny) in this class.

MATH152 Statistics for Engineers

Pre-requisites: Engineering Calculus

Ashesi Units: 1; Credit Hours: 4; Hours per week classroom: 3; Hours per week lab: 1

Hours of Study outside of the class (reading, assignments, studying, projects, and so on: 8 per week)

This course is a calculus-based, mathematical introduction to the fundamental principles of probability theory, statistics, and applications. Topics include descriptive measures, the axioms and properties of probability, combinatorial analysis used in computing probabilities, conditional probability, independence of events, sampling theory, discrete and continuous random variables, the standard distributions, estimation and hypothesis testing, analysis of variance, regression and correlation, expected value and variance, joint distributions, distributions of a function of a random variable, and sampling distributions. Also included are theoretical results such as Bayes Theorem, Central Limit Theorem, Law of Large Numbers, the Empirical Rule, Hypothesis Testing and Confidence intervals at least for a single mean and a single proportion. Programming in R or a similar language will be used to gain experience with statistical analysis in practice.

MATH 161 Engineering Calculus

Required for CE, EE and ME students

Pre-requisites: none

This course equips students with knowledge of differential and Integral Calculus which is fundamental to the field of Engineering. The focus is three dimensional: Concepts, Methods and Applications. Technology such as graphing utility and GeoGebra will be used to aid concept building and solution process.

MATH212 Linear Algebra

Prerequisites: Calculus 1 and 2; Applied Calculus

Ashesi Units: 1; Credit Hours: 4; Hours per week classroom: 3; Hours per week lab: 1

Hours of Study outside of the class (reading, assignments, studying, projects, and so on: 8 per week)

This course is a one semester course in Linear Algebra and its applications. The course will focus on concepts, underlying theory, techniques and applications of linear systems, linear transformations and vector spaces in the computer science and engineering domains. Aspects of the course will be hands-on and project-based and will make use of the mathematical software Matlab to aid data explorations and computations.

MATH221 Statistics with Probability

Prerequisites: Pre-Calculus 2 or Calculus 1

Ashesi Units: 1; Credit Hours: 4; Hours per week classroom: 3; Hours per week lab: 1

Hours of Study outside of the class (reading, assignments, studying, projects, and so on: 8 per week)

What influences consumer choices? Why are some people healthier, academically more successful, or more athletic than others? Are you interested in understanding how climate change is impacting communities in your home country? How can the vast amount of data collected and stored online be used to improve our quality of life? The discipline of statistics seeks to turn data into useful information that can help answer these and many other questions that may pique your interest. In this course, learning statistics will be motivated by using real data to answer questions that YOU are passionate about. Each student will: (1) generate a testable hypothesis from real data; (2) understand how large datasets are structured; (3) format and manage data; (4) conduct descriptive and inferential statistical analysis; and (5) communicate the results of their research to expert and novice audiences. The process of converting data into useful information draws on the following statistical foundation skills taught in the course:

- Producing data
- Exploratory data analysis
- Probability
- Inference

Statistical computing software is the essential tool that ties the quantitative research process together. In this course, you will use R and R Studio to manage data, carry out statistical analysis, conduct simulations, and create graphs and charts to represent data visually – all in the service of answering your own interesting research

question!

MATH233 Quantitative Methods

Prerequisites: Pre-Calculus 2 or Calculus 2 AND Statistics or Statistics for Engineering & Economics

Ashesi Units: 1; Credit Hours: 4; Hours per week classroom: 3; Hours per week lab: 1

Hours of Study outside of the class (reading, assignments, studying, projects, and so on: 8 per week)

This course will survey quantitative approaches to work in the business world. The course introduces students to concepts, techniques and software with which all successful managers should be familiar. The course has three main components: operation research/management science, project management, and statistics.

The course is hands-on, using spreadsheet techniques with minimal reference to complex or abstract mathematics and the R software. The statistical tests will be useful in nearly any senior project work, as well as any significant quantitative decision making in a business context.

Objectives:

- 1. To develop analytical and conceptual thinking skills.
- 2. To practice logical approaches to problem-solving.
- 3. To develop algebraic and spreadsheet modelling skills.
- 4. To be able to use the R software in solving statistical problems.

Learning outcomes

Upon successful completion of the course, students will be expected to:

- 1. Apply some commonly used Operational Research/Management Science (OR/MS) techniques.
- 2. Construct algebraic and spreadsheet models to inform business decisions.
- 3. Identify data requirements for typical OR/MS methods.
- 4. Implement models in Excel and interpret solutions from a managerial perspective.
- 5. Use the R software to solve statistical problems in multiple linear regression, time series analysis, binary logistic regression, etc.
- 6. Present a persuasive argument to peers about a business decision based on a mathematical model using appropriate data.

MATH 251 Differential Equations & Numerical Methods

Prerequisites: Multivariable Calculus & Linear Algebra, Applied Programming for Engineering or Computer Programming for CS

Ashesi Units: 1; Credit Hours: 4; Hours per week classroom: 3; Hours per week lab: 1

Hours of Study outside of the class (reading, assignments, studying, projects, and so on: 8 per week)

This course will introduce students to the topics associated with differential equations and applied numerical methods in solving engineering problems. Students will learn how to translate engineering problems into differential equations, develop MATLAB models and investigate different numerical methods to find solutions.

Using software, students will learn how to solve differential equations, find roots of equations, the method of gradient descent, discrete and continuous optimization, and finding the solution of linear equations using numerical methods. Techniques will be applied in a series of projects focused on engineering applications.

Topics: Analytic differential equations and modeling of engineering problems using differential equations; first order differential equations, systems of two first order equations, second order linear equations; homogeneous linear equations, nonhomogeneous equations; the existence and uniqueness of a solution, approximation; numerical solutions of linear equations, Euler and Runge-Kutta methods; root finding, gradient descent, discrete and continuous optimization; the Laplace Transform and Inverse Laplace Transform.

IS 351 Systems Analysis & Design

Prerequisites:

Ashesi Units: 1; Credit Hours: 4; Hours per week classroom: 3; Hours per week lab: 1

Hours of Study outside of the class (reading, assignments, studying, projects, and so on: 8 per week)

This course will cover the principals of information systems including analysis and design. Students will learn techniques in data requirements collection and analysis along with methods to modeling data needs. Modeling of data will occur at the conceptual, logical, and physical levels along with an ability to compare and contrast the different approaches given their merits and limitations. Students will understand the importance and constraints imposed by the domain of the information system along with business rules that guide the design. Functional dependencies and domain normalization will also be discussed as part of the requirements analysis. Object-oriented information system modeling will be surveyed. User-centered design techniques will be explored.

IS 361 IS Project Management

Prerequisites: Multivariable Calculus & Linear Algebra, Applied Programming for Engineering or Computer Programming for CS

Ashesi Units: 1; Credit Hours: 4; Hours per week classroom: 3; Hours per week lab: 1

Hours of Study outside of the class (reading, assignments, studying, projects, and so on: 8 per week)

This provides you with a comprehensive introduction to project management in an information technology / information systems context. It will explain the need for project management and the issues associated with managing projects in the IS/IT context. It will explain the key phases of the project management cycle and describe the various tools and methods used in each of those phases. The course will consider both theoretical and practical perspectives and equip you with the necessary skills to be able to better manage or participate in projects. The course is built around the Project Management Body of Knowledge (PMBoK) from the Project Management Institute aims to equip you with both theory and practical skills in the management of software development and information systems implementation projects. These skills will also be of considerable benefit in completing later year courses and later in your career. The course also aims to further your development as a scholar and future business professional. The course will refine your communication skills and group-work skills, improve your time management and assist in your research skills. The course assumes no prior experience in project management but does assume that you are familiar with the systems development lifecycle and have a good understanding of the processes involved in the development of information systems. INFS1602 (or equivalent) is the only prerequisite for this course.

Engineering

Engineering Core

ENGR 112 Introduction to Engineering

Required of CE, EE, and ME students

Prerequisite: Foundations of Design & Entrepreneurship 1 & 2

Ashesi Units: 1; Credit Hours: 5; Hours per week classroom: 3; Hours per week lab: 2

Hours of Study outside of the class (reading, assignments, studying, projects, and so on: 10 per week)

This course will introduce students to engineering by using practical problems and products from their surroundings. The course will challenge students to analyze the design and function of systems by using principles from different engineering fields including computer, electrical and electronic, and mechanical engineering. Students will study the contribution of material engineering, mechanical engineering, electrical and electronic engineering and computer engineering in making everyday objects, and the manufacturing processes needed for small and large-scale production. Students will also critically evaluate selected products from diverse perspectives: design/usability/utility, energy/environmental view, recyclability/waste/breakage, etc., to begin the conversation of the engineering profession's responsibility and contribution to society.

Topics: Design for engineering, case studies, engineering drawing and presentations, manufacturing process and methods, computer integrated manufacturing, safety in engineering, environmental impact and sustainability, topics in the profession of engineering.

Practical Sessions: CAD drawing using AutoCAD, assembling and disassembling products, practical skills in operating lab and field equipment, safety drills, basic design and implementation projects.

ENGR 212 Instrumentation for Engineering

Required of CE, EE, and ME students

Prerequisite: Statistics for Engineering and Economics, Physics I: Mechanics, and Physics II: Electromagnetism

Ashesi Units: 0.5; Credit Hours: 2; Hours per week classroom: 1; Hours per week lab: 1

Hours of Study outside of the class (reading, assignments, studying, projects, and so on: 4 per week)

This course continues the concept of measurement and measurement error that is introduced in the Physics sequence. Students study measurement systems, instruments, and measurement errors, and the use of probability and statistical analysis to design and execute experiments in the presence of measurement errors. An emphasis of the course is the design of instrumentation for experimental problem solving in real systems.

Topics: Survey of physical quantities typically measured, both physical and electrical. Analog signal conditioning for instrumentation. Measurement errors and implications on experimental design, planning, execution, and analysis. Parameters of sensors and transducers. Applications to process control and instrumentation (including pressure systems, temperature control, flow control, level control). Sensors appropriate to linear or angular acceleration, velocity, and position, DC and AC voltage, electrical resistance, capacitance or induction. DC null instrumentation such as Wheatstone Bridges.

Textbook: Robert Northrop, Introduction to Instrumentation and Measurements, 2nd Edition, CRC Press, 2005.

ENGR 300 Third Year Group Project and Seminar

Required of CE, EE, and ME students

Prerequisite: Leadership Seminar 4 for Engineers and System Dynamics, concurrent enrollment in Control Systems Ashesi Units: 0.5; Credit Hours: 2; Hours per week classroom: 1.5; Hours per week lab/discussion: 2 (or more hours independent work)

Hours of Study outside of the class (reading, assignments, studying, projects, and so on: 10 per week) In their third year, engineering students will participate in a one-year group project that ideally cuts across multiple engineering fields (electrical and electronic, mechanical and computer), to revisit the design process at a higher level, to deepen teamwork skills, and to reinforce system level thinking. Part 1 of the third-year project is implemented through *Leadership 4 for Engineers*, which will address leadership, service learning, and

responsibilities of the engineering profession to the community. Projects undertaken will include a service-learning component. Students will consider more than technical feasibility in their solutions, but also the desirability and sustainability of their solution to the community and the environment. In the course Third Year Group Project and Seminar, a weekly seminar that will facilitate group meetings and coordinate milestone completions, as well as provide a forum for discussion regarding professional issues and system level design. Students will also be required to reflect on their teamwork experiences, their own learning, and their completed group project, and present their project in a public forum. Learning objectives for the Third Year Group Project and Seminar include a maturing of design thinking and creative thinking skills, consideration of qualities such as environmental and societal impacts of their design, deepening of system-level thinking, project management experience, teamwork and communication skills development.

ENGR 311 System Dynamics

Required of CE, EE, and ME students

Prerequisites: Multivariable Calculus & Linear Algebra, Circuits & Electronics, Applied Programming for Engineers

Ashesi Units: 1; Credit Hours: 4; Hours per week classroom: 3; Hours per week lab: 2

Hours of Study outside of the class (reading, assignments, studying, projects, and so on: 10 per week)

Students will apply a broad range of mathematical tools to systems represented by linear, lumped-parameter models. Many physical domains are considered, including translating and/or rotating mechanical, electrical, thermal and fluid systems. Planar motion of rigid bodies will also be studied. Analysis techniques include both transfer function and state-space representations. Time and frequency domain analyses are included, along with a brief introduction to Control Theory. This course includes a laboratory.

Topics: Development of system equations in many engineering domains (mechanical, electrical and electromechanical systems, fluid and thermal systems); applications of linear algebra, Laplace transforms, and Fourier analysis methods to problems in many engineering domains; transient and frequency domain response of systems; transfer functions and state space representation of systems; importance of poles and zeroes of a system; vibrating systems. Time-domain and frequency-domain analyses of dynamic systems, time-domain analyses of control systems, frequency-domain analyses and the design of control systems.

Lab Exercises: MATLAB; measurement of physical systems, modeling and simulation of linear systems; accelerometer, thermal, and oscilloscope measurement and modeling.

ENGR 312 Control Systems

Required of CE, EE, and ME students Prerequisite: System Dynamics

Ashesi Units: 1; Credit Hours: 4; Hours per week classroom: 3; Hours per week lab: 2

Hours of Study outside of the class (reading, assignments, studying, projects, and so on: 10 per week)

Students will model dynamic mechanical systems in planar motion and use computer simulations to study them. Students build on the modeling and analysis techniques from System Dynamics to analyze and design controllers for linear systems. Practical examples from different engineering fields will be discussed. Students will analyze and design control systems in both continuous and discrete time, using both classical and modern techniques. Nonlinear dynamic models are introduced.

Topics: Continuous and discrete time control; classical control – stability and design of systems using root locus and; modern control – state space and pole placement methods; models of physical systems (in the frequency and time domains), state-variable models, system responses (time response), control system characteristics, stability analysis (including Routh-Hurwitz criterion), steady-state errors. Root-Locus analysis and design, Nyquist/Bode methods, frequency-response analysis, frequency-response design, modern control design, discrete-time systems, also design via state space., sampled-data systems, analysis and design of digital control systems, discrete-time pole-assignment and state estimation, nonlinear system analysis, electro-mechanical actuators, and sensors.

Lab Exercises: Simulation, measurement and design of dynamic systems using LabView and/or MATLAB/Simulink, analytical instrumentation, industrial process techniques and instrumentation, process control methods,

calibration, detection sensors, programmable controllers.

ENGR 400 Senior Project 1 (students do not officially register for this, however seminars are organized in Semester 1)

Required of CE, EE, and ME students

Prerequisite: Third Year Project and concurrent enrollment in Project Management and Professional Practice

Credit Hours: 4; Hours per week classroom: 1 (meeting with advisor(s)); Hours per week lab: 4 (or more hours independent work)

Hours of Study outside of the class (reading, assignments, studying, projects, and so on: 14 per week)

In their final year, engineering students will undertake an individual or small group project (no more than 3 students) as a capstone experience to further their expertise in system level design, application, and the practice of the profession. These projects are supervised by faculty and sometimes by a professional from industry in addition to the faculty. The projects are designed to demand the application of skills the student has learned throughout the four years of the programme. Group projects are expected to cut across engineering disciplines and be more substantial in scope and effort than individual projects. One option for the senior project will be working with a corporate partner on a real-world engineering design and application project, called an *Ashesi-Corporate Project*. In these projects, students from different engineering majors and/or other disciplines (e.g. Computer Science, MIS, or Business) will work together on a project under the direction of both an Ashesi faculty member and a corporate partner, with funding provided by the corporate partner. Participation in Ashesi-Corporate Projects is competitive and is not guaranteed.

Senior Project 1 runs concurrently with Project Management and Professional Practice, which will serve to guide the project management timeline of the project. In addition, students will meet with their project supervisors regularly, and their project work will be assessed at the end of Senior Project 1.

Learning objectives include a maturation of design and system-level thinking, project management expertise, and a deep understanding of professional issues such as certification, professional boards and oversight, communication, ethics, and responsibility to employers, customers, society, and the environment.

ENGR 401 Senior Project and Seminar 2

Required of CE, EE, and ME students

Prerequisite: Senior Project 1

Credit Hours: 4; Hours per week classroom: 1.5 (seminar and meeting with advisor(s)); Hours per week lab: 4 (or more hours independent work)

Hours of Study outside of the class (reading, assignments, studying, projects, and so on: 14 per week)

This is a continuation of Senior Project 1. In Senior Project & Seminar 2, a one hour per week seminar provides a discussion forum for technical writing, ethics and social responsibility, and other topics, and will also serve to guide the project management timeline of the project. At the end of the senior project, students will write a summary of their work and do a public presentation of their work. To reinforce professional writing, each member of a senior group project will write-up their own supporting documents.

Learning objectives for the final year capstone project and seminar include a maturation of design and system-level thinking, project management expertise, and a deep understanding of professional issues such as certification, professional boards and oversight, communication, ethics, and responsibility to employers, customers, society, and the environment.

ENGR 413 Project Management and Professional Practice

Required of CE, EE, and ME students. BA/MIS students can enroll in this course as a Business Elective.

Prerequisite: Microeconomics or Principles of Economics, Leadership Seminar 4 for Engineers, and at least 6 Engineering courses

Ashesi Units: 1; Credit Hours: 4; Hours per week classroom: 3; Hours per week discussion: 1

Hours of Study outside of the class (reading, assignments, studying, projects, and so on: 8 per week)

In this course students will learn to plan, strategize and execute an engineering project. The course will develop students' skills to manage projects and build on leadership skills and ethical reasoning they have acquired in core courses. Student will learn about environmental, safety and health issues that have to be considered during the implementation of a project. Students will also learn, discuss, and reflect on professional issues such as social responsibility, ethics, licensing, and regulatory reporting.

Topics: Project life cycle, feasibility study, planning, scheduling, cost estimation, resource allocation, budget management, monitoring and evaluation, logistics, management technology, managing project variables (including time management and quality management) professional, ethical, and health and safety issues. Introduction to Industrial Engineering (theory, practice, application), process management (labor, materials, overhead, risk management), work measurement, capacity utilization and constraints.

ENGR 414 Introduction to Environmental Science and Engineering

Elective for CE, EE, and ME students

Prerequisite: Concurrent enrollment in Thermodynamics

Ashesi Units: 1; Credit Hours: 4; Hours per week classroom: 3; Hours per week lab: 2

Hours of Study outside of the class (reading, assignments, studying, projects, and so on: 10 per week)

This course begins with a discussion of the local and global environment, environmental compartments and their relationship, pollution in these compartments, and basic descriptors. Systems analysis for environmental problems in areas such as water pollution, air pollution, solid and hazardous wastes, water and energy supply, and resource depletion are discussed, with an emphasis on the design of technological solutions. Students will work on projects in areas as varied as: renewable energy technologies, water quality, air quality, generators, increasing efficiency of appliances, urban planning, and cooking stoves.

Topics: Mass and energy transfer, environmental chemistry, mathematical modeling of growth, risk assessment, water pollution, water quality control, air pollution, global climate change, solid waste reduction, recycling, and management.

SC112 Physics I Mechanics

Required of CE, EE, and ME students Prerequisite: Calculus I (or Applied Calculus for non-Engineering majors) Ashesi Unit Units: 1; Credit Hours: 4; Hours per week classroom: 3; Hours per week lab: 2 Hours of Study outside of the class (reading, assignments, studying, projects, and so on: 10 per week)

This course is an introduction to classical mechanics and fundamental physics theories. The course will focus on motion of objects using basic kinematic and kinetic principles. At the end of the course, students will have a firm understanding and practical experience with the fundamental mechanics theories. Some topics introduced in this course will be expanded in other advanced courses, such as Introduction to Thermal and Fluid Dynamics, Thermodynamics, Heat and Thermal system and Dynamic Systems. Writing quality lab reports will also be emphasized.

SC113 Physics II Electromagnetism

Required of CE, EE, and ME students

Prerequisite: Physics I Mechanics

Ashesi Units: 1; Credit hours: 4; Hours per week classroom: 3; Hours per week lab: 2

Hours of Study outside of the class (reading, assignments, studying, projects, and so on: 10 per week)

This course is an introduction to electrostatics, electrodynamics and electromagnetism. The basic principles behind electrical engineering and electronic communication will be discussed. At the end of the course students will understand simple electronic circuits and the fundamental theories and principles needed to continue their study of electronics and electrical systems. Writing quality lab reports will continue to be emphasized.

Computer Engineering Courses

CE 122 Applied Programming for Engineers

Required of CE, EE, and ME students

Prerequisite: Calculus 2 and Computer Programming (for Engineering or Computer Science)

Ashesi Units: 0.5; Credit Hours: 2; Hours per week classroom: 1.5

Hours of Study outside of the class (reading, assignments, studying, projects, and so on: 3 per week)

This course will build on students' existing computer programming experience and teach students how to use computers to solve engineering problems. Students will use the modeling skills they have gained from their mathematics courses and apply it to develop engineering simulations. Students will gain experience in writing applications in languages commonly found in engineering, such as C or Python. Students will also learn how real numbers are represented by computers, especially insofar as they affect precision and accuracy of calculations.

Topics: Programming in C and/or Python, simulation and the modeling process; errors, modeling errors, implementation errors, absolute and relative errors, error propagation; issues of numeric representation, calculation, and precision; modeling problems involving rate of change, under constrained growth and decay, constrained growth; modeling problems involving force and motion; data-driven models, monte-carlo simulations.

Lab Exercises: Scientific programming and simulations. Modeling specific problems such as falling motion, pendulum motion, gas motion and disease spread.

CE 322 Digital Systems Design

Required of CE, EE, and ME students Prerequisite: Circuits and Electronics

Ashesi Units: 1; Credit Hours: 4; Hours per week classroom: 3; Hours per week discussion/lab: 1.5 Hours of Study outside of the class (reading, assignments, studying, projects, and so on: 9 per week)

In this course students will study the principles of digital systems and computers. They will learn digital system theory and design techniques, including Boolean algebra, binary arithmetic, digital representation of data, truth tables, gates, flip-flops, finite state machines, memory, and timing issues. Students will gain experience with several levels of digital systems, from simple logic circuits to microcontrollers, in order to design, simulate and implement digital systems. They will also learn how processors and microcontrollers are used for control by interfacing sensors and actuators.

Topics: Binary numbers and operations, Boolean algebra, combinational and sequential logic, digital system design, finite state machines, hardware description language (such Verilog or VHDL), programmable devices, ADC and DAC, interface protocols, processor and microcontroller architecture and interface.

Lab Exercises: CAD tool and FPGAs, Introduction to HDL (Verilog or VHDL), combinational circuits (adder, encoder and decoders, multiplexer), sequential digital modules: (registers, timer), data acquisition, microcontroller, etc.

CE 451 Embedded Systems

Required of CE and EE students, elective for ME students

Prerequisite: Computer Programming (for Engineering or Computer Science) and Digital Systems Design (or Computer Organization for non-Engineering students)

Ashesi Units: 1; Credit Hours: 4; Hours per week classroom: 3; Hours per week discussion/lab: 1.5 Hours of Study outside of the class (reading, assignments, studying, projects, and so on: 9 per week)

This course will cover the design and implementation of embedded systems from a hardware and software perspective. Students will go through the design process of embedded systems and analyze the tradeoff between a hardware and software implementation. They will also learn software development techniques unique to embedded systems such as real-time operations, I/O operations, and communications. The bare metal approach to embedded systems development is highlighted. Students will learn to read data sheets and implement drivers with bit-level manipulation. There is an emphasis on creating responsive multitasking systems. An introduction to a Real Time Operating System will be given.

Course Objective:

- After successful completion of this course, students will be able to:

- Design an embedded system given user requirements.
- Evaluate what microcontroller to choose to address a problem, given a set of constraints.
- Create embedded systems software that employs cooperative multitasking and interrupts to make a responsive system.
- Make use of common microcontroller peripherals including GPIO, timers & counters, analog I/O, and serial communications to interface the real world.
- Use ARM Assembly Language (based on ARM Cortex-M0+)
- Properly organize/structure embedded C code (use of finite state machines, to improve responsiveness and organization of code into files and libraries)
- Use Assembly and C together to improve efficiency of embedded systems software.
- Interpret datasheets for electronic components and microcontrollers to be able to create appropriate reusable C based libraries
- Analyze embedded system requirements and the trade-off between hardware and software implementation
- Integrate embedded subsystems in higher voltage systems

Electrical and Electronic Engineering Courses

EE 222 Circuits and Electronics

Required of CE, EE, and ME students

Prerequisite: Physics II: Electromagnetism and Multivariable Calculus & Linear Algebra

Ashesi Units: 1; Credit Hours: 4; Hours per week classroom: 3; Hours per week discussion/lab: 2

Hours of Study outside of the class (reading, assignments, studying, projects, and so on: 10 per week)

In this course students will study the principles and workings of electronic components and design circuits common in electronic systems like amplifiers and filters. Students will learn how to develop mathematical models for electronic circuits and find solutions in time and frequency domain. At the end of the course students should have learnt how to model and design simple analog electronics systems.

Topics: Electronic components (resistors, capacitors, inductors, diodes, transistors, relays, switches and transformers), solid state components (diodes, transistors, zener, photo diode, FET, MOSFET), circuit analysis, Kirchhoff's Laws, Norton's Theorem, Thevenin's Theorem, electronics networks, analog electronic circuits like amplifiers and filters, power sources, time domain and frequency domain solutions

Lab Exercises: Characteristics of electronic components like diode, pn junction, transistor, analysis and simulation of analog circuits, design of amplifiers, filters, rectifiers, oscillators, etc.

EE 242 Introduction to Electrical Machines and Power Electronics

Required of EE and ME students, elective for CE students

Prerequisite: Physics I: Mechanics, Physics II: Electromagnetism, and previous or concurrent enrollment in Circuits & Electronics

Ashesi Units: 1; Credit Hours: 4; Hours per week classroom: 1.5; Hours per week discussion/lab: 2 Hours of Study outside of the class (reading, assignments, studying, projects, and so on: 7 per week)

This is a hands-on course that introduces students to the fundamental principles underlying electro-mechanical machines and devices, their design, and their maintenance. It provides a treatment of transformers, synchronous generators and motors, induction motors, DC motors, speed and torque control, protective devices, an introduction to power electronics, electrical (regenerative) braking.

Topics: Introduction to machinery principles; Transformers: (types and construction, Ideal transformer, single phase, tap changing, efficiency, equivalent circuit, autotransformer, three phase using two phase transformers, instrument transformers); Introduction to Power Electronics: components (diode, thyristor, DIAC, TRIAC), rectifier circuits; AC Machinery Fundamentals: rotating magnetic field, mmf and flux distribution, induced voltage and torque (2-pole stator, 3-phase coils), winding insulation, power flows and losses, voltage and speed regulation, Synchronous Generators: construction, speed, equivalent circuit, phasor diagrams, power and torque; Synchronous Motors: equivalent circuits, steady state operation (characteristic curves for torque, speed, load,

power factor correction, synchronous capacitor etc.); Induction Motors: construction, torque, slip, frequency on rotor, equivalent circuits (transformer model, rotor model etc.), power and torque, motor-torque speed characteristics, starting circuits, speed control (pole changing, frequency, voltage, rotor resistance), induction motor drives; DC Machinery Fundamentals: commutation, construction, problems with commutation, power flow and losses, internal generated voltage and induced torque; DC Motors: separately excited and shunt DC motors, permanent magnet DC motor, series and compound DC motor (torque, speed characteristics and speed control), overview of DC starters.

Lab Exercises: Starting arrangements, coupling, motor performance under changing load and voltage, speed and torque control.

EE 321 Communication Systems

Required of CE and EE students, elective for ME students

Prerequisite: Physics II: Electromagnetism, Circuits and Electronics

Ashesi Units: 1; Credit Hours: 4; Hours per week classroom: 3; Hours per week discussion/lab: 1.5 Hours of Study outside of the class (reading, assignments, studying, projects, and so on: 9 per week)

Students will learn the working principle and design of modern wired and wireless electronic communication systems. The course focuses on basic principles in the analysis and design of modern communication systems, the workhorses behind the information age. The treatment of analogue communications serves as a necessary background for understanding digital communications. At the end of the course, the students will have an introduction to electronic communication systems and their building blocks.

Topics: Deterministic and random signals and signal space, analysis and transmission of signals, transmission media and devices, analog and digital modulation systems (including amplitude modulation and demodulation, angle modulation and demodulation), sampling and analog to digital conversion, principles of digital data transmission, transmission over dispersive channels, fundamentals of probability theory, random processes and spectral analysis, performance analysis of modulated communication systems under noise, performance analysis of digital communication systems, spread spectrum communications, digital communications under linearly distortive channels, channel models, information theory, source and channel coding, error correcting codes.

Lab Exercises: Modulation, spectrum analysis, encoders and decoders, error detection and correction, signal strength.

EE 342 Electrical Machines II

Required of EE and elective for ME students

Prerequisite: Introduction to Electrical Machines and Power Electronics

Ashesi Units: 1; Credit Hours: 4; Hours per week classroom: 1.5; Hours per week discussion/lab: 3 Hours of Study outside of the class (reading, assignments, studying, projects, and so on: 9 per week)

This is an advanced class that provides students further principles governing the operation of electro-mechanical machines and devices, their design, and their maintenance. There is also a treatment of special purpose motors such as variable reluctance machines and stepping motors. It provides an advanced treatment of power electronics, synchronous generators and motors including transients, induction motors (with topics including determining circuit model parameters etc.), induction generators, DC generators, parallel generators, transformers, single-phase and two-phase motors, speed and torque control.

Topics: Power Electronics: components (diode, thyristor, DIAC, TRIAC, power and speed comparison), rectifier circuits, pulse circuits, voltage variation by AC phase control, DC-to-DC power control-choppers, inverters, harmonic problems; Synchronous Generators: measuring model parameters, parallel operation of AC generators, synchronous generator transients, generator ratings (voltage, speed, frequency, power factor ratings, capability curves, short time operation and service factor); Synchronous Motors: characteristic curves, motor starting (with reduced frequency, external prime mover, amortisseur windings etc.), synchronous generators, motor ratings; Induction Motors: construction, torque, slip, frequency on rotor, equivalent circuits, characteristic curves, induction motor drives, determining circuit model parameters, induction generator, motor ratings; DC Motors and Generators: equivalent circuit, magnetization curve of DC machine, review motor types, and characteristics, DC

starters, solid state speed controllers, efficiency, DC generators, (separately excited, shunt, series, cumulatively compounded and differentially compounded DC generator); Single-Phase and Special-Purpose Motors: single phase induction motors, cross field theory of single phase induction motors, starting arrangements (split phase, capacitor-start, permanent split, capacitor start-capacitor-run, shade pole,) speed control, equivalent circuit, Reluctance motors, hysteresis motor, stepper motors, brushless DC motors.

Lab Exercises: Thyristors, AC and DC motor control, servo motors, variable speed drives (AC and DC drives).

EE 421 Digital and Analog Signal Processing in Telecommunications

Elective for CE and EE students

Prerequisite: Communication Systems

Ashesi Units: 1; Credit Hours: 4; Hours per week classroom: 3; Hours per week discussion/lab: 1.5 Hours of Study outside of the class (reading, assignments, studying, projects, and so on: 9 per week)

This course includes the study of signal processing and technology used in the telecommunication industry. Students will study various digital and analog signal processing techniques. Starting from the basic definitions of a discrete-time signal, through Fourier analysis, filter design, sampling, interpolation and quantization, more advanced tools are studied to aid the study and design of digital communications systems. Note: CE and EE students wishing to work in the telecommunications industry are advised to take *Digital and Analog Signal Processing in Telecommunications* as one of their electives.

Topics: Discrete time signals and systems; transform analysis of linear time invariant systems, z-transforms, sampling of continuous-time signals, structures for discrete-time systems, Fourier transforms, fast Fourier transforms, computation of the discrete Fourier transform, Fourier analysis of signals using the discrete Fourier transform, signal averaging, signal compression, convolution, parametric signal modeling, discrete Hilbert transforms filters, complex techniques, and applications of all of these.

Lab Exercise: Signal processing, spectrum analysis.

Mechanical Engineering Courses

ME 301 Mechanical Machine Design

Required of ME students, elective for EE students

Prerequisite: Physics I: Mechanics, Mechanics of Materials

Ashesi Units: 1; Credit Hours: 4; Hours per week classroom: 1.5; Hours per week discussion/lab: 3 Hours of Study outside of the class (reading, assignments, studying, projects, and so on: 9 per week)

This class will introduce students to the common components of machine design.

Topics: Principles of Machine Design; Materials; Stress and Deformation Analysis, Combined Stresses and Mohr's Circle, Design for Different Types of Loading; Fabrication Methods; Safety and Tolerance in Design and Fits; Design for Maintainability. Machine Frames, Design of Bolted Joints, Welded Joints, Screws, Springs, Hub-Shift Joints, Shafts and Shafting, Axles, Rolling Contact Bearings, Plain Surface Bearings, Gears and Gearing (including spur, helical, bevel gears and Wormgearing), Coupling Systems and Torque Converters, Keys and Seals; Transmission Systems, Linear Motion Elements, Lubrication, Belt Drives and Chain Drives, Kinematics of Gears; Applications of Machine Parts, Design of Power Transmission; Electric Motors and Controls, Motions Control (clutches and brakes).

Labs: Design projects involving CAD and fabrication of machine assemblies and components.

ME 311 Mechanics of Materials

Required of ME students, elective for EE students

Prerequisite: Physics I: Mechanics, Materials Science & Chemistry, and Dynamic Systems

Ashesi Units: 1; Credit Hours: 4; Hours per week classroom: 3; Hours per week discussion/lab: 2

Hours of Study outside of the class (reading, assignments, studying, projects, and so on: 10 per week)

This course is the study of static mechanics of deformable bodies and introduces the design of engineering

structures. Students will study the concept of stress and strain at a point, stress-temperature relationships, force and deformation analyses of bodies under axial, shearing, flexural, torsional and combined loadings, shear and bending moment diagrams, and Euler Columns. This course focuses on the application of static mechanics on engineering materials and structures. Students will learn how to model and simulate structures with distributed loads, thermal loads and torsional loads using software, scaled models and others for analysis and testing. At the end of the course students will be able to analyze integrity and stress of common engineering structures.

Topics: Equilibrium, stress, strain, deformation, elasticity, thermal stress, shear stress, stress concentration, elastic buckling of columns, bending of beams, concrete mixtures and structures, foundations. Energy methods of solving statically indeterminate situations.

Lab Exercise: Tension and compression, modulus of elasticity, measurement of torsion in shafts, coefficient of thermal expansion, modeling and simulation of structures.

ME 411 Thermodynamics

Required of EE and ME students, elective for CE students Prerequisite: Physics I: Mechanics, Dynamic Systems

Ashesi Units: 1; Credit Hours: 4; Hours per week classroom: 3; Hours per week discussion/lab: 1.5 Hours of Study outside of the class (reading, assignments, studying, projects, and so on: 9 per week)

This is an integrated course of thermodynamics and fluid dynamics theories and their application to engineering systems, and the study of heat transfer by conduction, convection, and radiation. The course will look at the application of thermodynamics and fluid dynamics principles in systems like engines, refrigeration cycles and pumps. Students will study in detail the basic sciences behind thermal and fluid systems.

Topics: Ideal gas, thermodynamics laws, thermodynamic states or entropy and reversible and irreversible processes, thermodynamic equilibrium and entropy, heat transfer, volume, mass and energy conservation, Carnot, Rankine, Brayton, and Otto cycles, classification of fluid flow, ideal fluid flow, laminar and turbulent flow, flow analysis, head loss in pipes, mixtures, combustions, design of heat exchangers, NTU method.

Lab Exercises: Simulation of thermodynamics systems and fluid dynamics systems. Gas laws, spark-ignition cycle experiments, heat transfer, and refrigeration cycles.

ME 421 Heat Transfer

Required of ME students, elective for EE students

Prerequisite: Thermodynamics

Ashesi Units: 1; Credit Hours: 4; Hours per week classroom: 3; Hours per week discussion/lab: 2 Hours of Study outside of the class (reading, assignments, studying, projects, and so on: 10 per week)

This course teaches students about design and analysis of thermal systems. Students will study the operation of different kinds of thermal engines, heating and cooling systems. They will apply thermodynamic and heat transfer principles to study thermal systems in different applications including power generation.

Topics: Rotodynamic machines (steam and gas turbine plants), positive displacement machines (compressors, pumps, air motors), reciprocating internal combustion engines, refrigeration, air-conditioning, psychrometry, and heat pumps. Heat transfer. Sources, use and management of energy.

ME 431 Fluid Mechanics and Applications

Elective for EE, ME students Prerequisite: Thermodynamics

Ashesi Units: 1; Credit Hours: 4; Hours per week classroom: 3; Hours per week discussion/lab: 1.5 Hours of Study outside of the class (reading, assignments, studying, projects, and so on: 9 per week)

This course is the application of fluid mechanics in engineering and industrial processes. The course will discuss theories and principles of fluid dynamics and statics using engineering applications as examples. They will learn how to design and analyze fluid systems like hydraulics, pneumatics, pipes, and pump systems. At the end of the

course students should be able to design and analyze different fluid systems.

Topics: Hydrostatic pressure, buoyancy, the Bernoulli equation. Reynolds numbers, and predicting laminar or turbulent flow. Head loss computations. Velocity profiles in laminar and turbulent flow. Pump selection based on the pipe network being supplied. Fans, blowers, and compressors selection.

Lab Exercise: Viscosity measurement, designing hydraulic systems, analysis and design of duct and pipe systems, simulation of fluid mechanics systems.

ME 441 Manufacturing Processes

Required for ME, Elective for CE, ME students

Prerequisite: none

Ashesi Units: 1; Credit Hours: 4; Hours per week classroom: 3; Hours per week discussion/lab: 2 Hours of Study outside of the class (reading, assignments, studying, projects, and so on: 10 per week)

Manufacturing industries are a vital component of all modern economies and all of them require employees who are skilled in, and knowledgeable about, manufacturing processes. This course is designed to provide students with an overview of a wide variety of manufacturing processes. It deals with the principles, analysis and selection of manufacturing processes. Students will understand solidification, metal forming and sheet metalworking, material removal, joining, and assembly processes. Manufacturing systems will be discussed. Design for manufacturing and manufacturing economics are introduced. Lab sections and an individual final project will provide students valuable hands-on experience in using machines to design and make products.

EE 451 Power Engineering

Elective for EE, ME students

Prerequisite: Circuits and Electronics, Introduction to Electrical Machines and Power Electronics Ashesi Units: 1; Credit Hours: 4; Hours per week classroom: 3; Hours per week discussion/lab: 1.5 Hours of Study outside of the class (reading, assignments, studying, projects, and so on: 9 per week)

This course is the study of electrical energy generation and use in various industries. The course will look at how electrical energy is generated from and converted to other forms of energy. Students will study power generation systems, transmission, distribution systems, electrical components, electric power utilization and power quality. Students will also study how to strategically bring together power technology to make needed energy available by considering need, the environment, and sustainability. Note: EE and ME majors wishing to work in the power systems industry are advised to take *Power Engineering* and *Power Systems Analysis* as their two electives.

Topics: Power generation technologies, power transformers, motors, power distribution analysis and design, power network monitoring and control, uninterrupted power supplies, hydro, thermal, and renewable power sources (e.g. solar, wind), high voltage components including transmission line structures, grid, operation, power stations and generating plants, protection, insulation, reactive power compensation, high voltage DC transmission, control systems and power system operation, distribution short circuit protection, electric power utilization (metering, load characteristics), power quality (e.g. harmonics, voltage fluctuations), and a review of synchronous electrical machinery and thermal generating plants.

Lab exercises: Power generators, transformer synchronization, conductance measurements, test and measurement of power systems, power system design. Group Project: network design, power system for industry, alternative power source, wind turbine, analyze solar power, etc.

EE 453 Power Systems Analysis

Elective for EE and ME students Prerequisite: Power Engineering

Ashesi Units: 1; Credit Hours: 4; Hours per week classroom: 3; Hours per week discussion/lab: 1.5 Hours of Study outside of the class (reading, assignments, studying, projects, and so on: 9 per week)

This course is a study of advanced topics in electric power distribution systems planning and operation. In this

course, students will learn how to analyze flows on power networks and their applications to real systems. It provides students with a working knowledge of power system problems and computer techniques used to solve some of these problems. It also provides a technical treatment of the general problem of power system stability and its relevance. They will learn how to strategically bring together power technology to make energy available to industry by considering need, environment and sustainability. Note: EE and ME majors wishing to work in the power systems industry are advised to take *Power Engineering* and *Power Systems Analysis* as their two electives.

Topics: Network equations, and per unit system, power transformers, transmission line parameters and modeling (including induction and complex power transmission), steady state and transient operation, transformer modeling, generator modeling (machine view point and circuit viewpoint), network matrices, power flow analysis (including solution by Newton-Raphson and Gauss iteration), faults (symmetrical and unsymmetrical), system protection, power system controls, transient stability, power distribution. Economic operation of power systems.

Lab Exercise: Transmission Line Modeling, transmission line with different load conditions, load flow analysis etc.

EE 422 Advanced Communication Systems

Elective for EE and ME students

Prerequisite:

Ashesi Units: 1; Credit Hours: 4; Hours per week classroom: 3; Hours per week discussion/lab: 1.5 Hours of Study outside of the class (reading, assignments, studying, projects, and so on: 9 per week)

The course will describe the protocols used in current networks. It will provide skills needed in designing and deploying efficient and effective data communications and network technologies. Key Topics include: Wireless and Mobile Communication (Cellular concept, propagation methods/models, antennae, Coding and multi access techniques, Higher Order Modulation – OFDM, etc.) Mobile generations and technology, Digital TV Broadcasting, Core network), Telecommunication Networks (PSTN, IP Radio Access Networks), Advanced Topics in IP Networks (Mobile IP, Quality of Service, Multimedia networking protocols), Switching, Wireless LAN and Mobile Ad-hoc Networks, Fiber Optic Communication and Network, Satellite communications.

This course will also develop understanding of some fundamental concepts of information theory, as well as techniques used to model and analyze communication networks. It will briefly highlight how to develop analytical tools and conceptual models for modeling and analyzing network performance. Subtopics will include: Fairness and network utility maximization, Optimization based routing and congestion control, Basic queueing models and their application to switching and scheduling in networks.

EE454: Renewable Energy and Smart Power Grid

Elective for EE and ME students

Prerequisite: Power System Engineering and Power Electronics

Ashesi Units: 1; Credit Hours: 4; Hours per week classroom: 3; Hours per week discussion/lab: 1.5 Hours of Study outside of the class (reading, assignments, studying, projects, and so on: 9 per week)

A Smart Grid is the integration of numerous technologies, systems and processes with the aim to modernize and fully automate the entire electricity grid covering generation, transmission, distribution, utilization plus conservation of energy. This course introduces students to smart grids and intelligent distribution networks. Renewable energy sources and their integration in smart grids as well as energy storage technologies are discussed and these include distributed generation technologies, control technologies, modeling and storage technologies. Demand side/load management is explored, including reactive power optimization. Other topics that this course addresses are smart metering techniques, grid network security and best practices in this domain. Students will also be introduced to electric vehicles in smart grids.

Key topics include: Information and communication technologies for smart grid, Communication technologies for the smart grid, information security, Sensing, measurement, control and automation technologies: smart metering and demand-side integration, distribution automation equipment, distribution management systems, transmission system operation. Power electronics and energy storage: power electronic converters, power electronics in the

smart grid, and for bulk power flows.

ENGR 442: Mechatronics Systems Design

Elective for EE and ME students

Prerequisite: Mechanics, Sensors, Control theory, Microcontrollers, Electronics, and Electrical Motors. Ashesi Units: 1; Credit Hours: 4; Hours per week classroom: 3; Hours per week discussion/lab: 1.5 Hours of Study outside of the class (reading, assignments, studying, projects, and so on: 9 per week)

Mechatronics is the synergistic integration of mechanical disciplines, controls, electronics and computers (software) in the design of high-performance machines, devices and processes. This course reviews principles in software programming, machine design, modelling of multi-domain dynamic systems, controls theory, electronics circuits, real-time controls implementation, and system-level integration. Hands-on lab exercises and projects provide extensive coverage of mechanical components, sensors, actuators, electrical drives, signal conditioning circuits, modelling and simulation tools, DAQ hardware and software (microcontrollers), and microprocessors. The main idea of the course is to review and interface the described subsystems to design fully integrated mechatronic systems that meet specified requirements.

EE442 Power Electronics

Elective for EE and ME seniors and juniors

Prerequisite: Credit Hours: TBD

Hours of Study outside of the class (reading, assignments, studying, projects, and so on: TBD per week)

In Power Electronics students will study various static methods to control the power flow between source and load. Due to the high level of power, the main solution for these methods is either forced switching for transistors or naturally for diodes; the thyristors present a forced switching ON and naturally switching OFF.

This subject aims at familiarizing the student with power electronic components in terms of *how they work* and *how they are applied*. First of all, the student must learn to know the operation and limitations of the different components. Secondly this course aims at creating an understanding of how these components are applied in different basic types of converters like ac-to-dc converters (rectifiers), dc-ac converters (inverters), dc-dc converters (choppers & switch-mode power supplies) and other types of power conversion methods. A basic foundation is also laid concerning the parameters with which the performance of these converters is measured.

Power Electronic converters like ac and dc drives are used more and more to control the speed and torque of ac and dc motors which are covered in subjects like Electrical Machines. The controlling of these motors by drives is used in factory processes. Electric drives are also introduced in this course.

Topics include Power Electronics Devices, Applications, Limitation of semiconductor devices and methods to prevent their failure, AC-to- DC Power Conversion, DC-to- DC Power Conversion (Choppers); DC-to- AC Power Conversion (Inverters), Control of Power Conversion in Power Electronics.

ENGR 443 Industrial Engineering

Elective for

Prerequisite: Students should have completed Algebra, Statistics and Engineering Design.

Ashesi Units: 1; Credit Hours: 4; Hours per week classroom: 3; Hours per week discussion/lab: 1.5 Hours of Study outside of the class (reading, assignments, studying, projects, and so on: 9 per week)

A central idea behind this course, as well as in the whole engineering education programme, is that the student should be trained in solving engineering problems for organisational development in technology-based companies and organisations. The major aim of the course is to give a general orientation about and a perspective on the subject of Industrial Engineering and maintenance operations, as well as to create interest in and understanding of the continued studies in the subject area. The course thus prepares the student for a professional career as an engineer of Industrial Engineering and Management and for further studies. This course will familiarize students with principles of methods engineering, forecasting techniques, layouts and material handling, human factors and

ergonomics, quality management and inventory control, and maintenance operations. We will discuss maintenance procedures and practices for mostly encountered components and machines in the production industry.

CAD/CAM

Elective for Prerequisite: Credit Hours: TBD

Hours of Study outside of the class (reading, assignments, studying, projects, and so on: TBD per week)

This course integrates computer-aided design (CAD) and computer-aided manufacturing (CAM) in modern manufacturing processes. It exposes students to CAD and CAM tools for use in engineering design conceptualization. The course involves introduction to CAD/CAM, advanced CAD modeling techniques, computer numerical control (CNC) machines, 3D printers, machine coded programmed instructions (G and M Codes), machine tooling, and introduction to finite element analysis (FEA), including topology optimization. Electrical engineering drawing will be introduced. Students will be exposed to various CAD, FEA, and CAM software. A project will be assigned that will involve design, analysis, evaluation and optimization, and a CAM system to generate and assemble a simple mechanical or electrical or electro-mechanical device.

Topics: Introduction to CAD, CAM, and CAE (Computer Aided Engineering), Machine Coded Programmed Instructions (G and M Codes), Computer Numerical Control (CNC) Machines, 3D Printers, and Machine Tooling. CAD: Geometric Modeling (2D and 3D Modeling, Parametric Modeling, Design of Molds, Sheet Metal Parts, Weldments, Surface Modeling, etc.) and Advanced Assembly Operations. FEA (Structural Analysis, including Topology Optimization). Electrical Engineering Drawing. Analysis of Mechanisms.

Industrial Automation

Prerequisite: Digital Systems Design or Electrical Machines

Ashesi Units: 1; Credit Hours: 4; Hours per week classroom: 3; Hours per week discussion/lab: 1.5 Hours of Study outside of the class (reading, assignments, studying, projects, and so on: 9 per week)

This course is a practical introduction to industrial automation systems, with applications to the process industry and discrete manufacturing. The course gives students both a hands-on introduction to this field and the theoretical underpinnings governing the design and workings of various components in an automation system. Topics include an overview of industrial automation and process control, automation circuits, components including actuators, sensors, timers, encoders, etc. The design, synthesis and implementation of automation circuits. State diagram realization, electro-pneumatic components, PLC technology and special purpose I/O modules, PLC programing. Industrial networks, SCADA systems Labs will include PLC programing, use of a range of common sensors, actuators, transmitters, use of electric drives, pneumatic components. Emphasis on common industrial applications.

Special Non-Major Electives

Analog signal processing and Computer Aid Design

Elective for

Prerequisite:

Ashesi Units: 1; Credit Hours: 4; Hours per week classroom: 3; Hours per week discussion/lab: 1.5 Hours of Study outside of the class (reading, assignments, studying, projects, and so on: 9 per week)

The goal of this lecturer is to help students to understand the principles of signal processing. Learn how to simulate and evaluate the main features using real examples of schematics.

- 1. Examples of sensors generating an electrical signal.
- 2. Why this signal needs to be processed. Introduction to noise issues.
- 3. Practical operational amplifiers: generalities, limitations and stability.
- 4. Read out chain using operational amplifiers (amplification, filtering, peak detectors, comparators, peak

detectors, multiplexing).

- 5. Introduction to switched-capacitor circuits.
- 6. Drivers and reference voltage.
- 7. Analog to digital converters: concept and basic architectures.
- 8. Digital data transmission.

Computer Science Courses

In today's society, every University graduate must be able to utilize computers as a tool in their professional work; this is especially true of engineers, whose technical work relies on computers for design, simulation, and modeling. In addition, computerized components are integrated into a myriad of engineered projects, and so all engineers should have grounding in basic programming and computer systems.

Computer Science core or elective courses for the Engineering Program are:

CS 112 Computer Programming for Engineering

Required of CE, EE, and ME majors, an option for CS and MIS majors as of Fall 2015

Prerequisite: Familiarity with computers

Ashesi Units: 1; Credit Hours: 4; Hours per week classroom: 3; Hours per week lab: 1.5

Hours of Study outside of the class (reading, assignments, studying, projects, and so on: 9 per week)

This is a first course in computer programming, primarily intended for students pursuing a major in computer science or engineering, and/or who have had some previous programming practice. Topics include computer representation of data, object-oriented programming, variables and assignments, primitive types and operations, conditional execution, iteration, arrays, classes, methods, recursion, object types, encapsulation, inheritance and reasoning about programs. The course includes a laboratory component designed to enhance conceptualization.

CS 222 Data Structures and Algorithms

Required of CE and CS majors, elective for EE, ME, and MIS majors

Prerequisite: Computer Programming (for Engineering or Computer Science)

Ashesi Units: 1; Credit Hours: 4; Hours per week classroom: 3; Hours per week lab: 1.5

Hours of Study outside of the class (reading, assignments, studying, projects, and so on: 9 per week)

This course covers fundamental abstract data types and their implementations as data structures such as lists and trees and introduces asymptotic analyses of algorithms involving these data structures. Students will also learn about searching (dictionaries, priority queues, and hashing); sorting (internal and external); graphs and algorithms on graphs (shortest path, minimum spanning trees); and pattern matching.

CS 312 Intermediate Computer Programming

Elective for CE, EE, ME and MIS majors, required for CS majors

Prerequisite: Computer Programming (for Engineering or Computer Science)

Ashesi Units: 1; Credit Hours: 4; Hours per week classroom: 3; Hours per week lab: 1.5

Hours of Study outside of the class (reading, assignments, studying, projects, and so on: 9 per week)

This course will introduce students to more details of object definition, program construction, and event-driven programming. It will also introduce additional standard Java packages, including the file system and graphical user interface elements. Basic data structures will be introduced and implemented, including lists, stacks, queues, and simple kinds of trees (through binary search trees). This course will also give students an introduction to C++ and to programming techniques for dynamic data structures. Students will study algorithms for ordering, searching, traversing and manipulating these data structures, including some recursive algorithms. Good software engineering practices will be featured in various aspects of the course, and notations similar to the Unified Modeling Language (UML) will be employed. Through one or more team projects, students will gain experience in designing and implementing larger systems. However, the emphasis of the course will be on the use of prewritten packages and built-in language facilities, as well as design and implementation of moderately sized custom classes

and algorithms, rather than on the design of whole systems.

CS 323 Database Management Systems

Elective for CE majors, required for CS and MIS majors

Prerequisite: Computer Programming (for Engineering or Computer Science) and Digital Systems Design (or Discrete Mathematics or Data Structures & Algorithms)

Ashesi Units: 1; Credit Hours: 4; Hours per week classroom: 3; Hours per week lab: 1.5

Hours of Study outside of the class (reading, assignments, studying, projects, and so on: 9 per week)

This course is an introduction to the design and use of database systems - systems that manages very large amounts of data. This course is an introduction to the principles, use, and applications of database systems. Students who complete the course will be able to design and create databases, be able to extract information from databases, understand in broad terms how database systems work, and understand the purposes for which databases are used. The course covers topics such as relational design using the entity-relationship model, followed by an overview of the relational model, how to convert E/R models to relations, and how one uses a relational database system to create a database. SQL (Structured Query Language), the standard query language for relational databases will be

learned and experienced as well as relational algebra; normalization of relational schemes. This course will be taught using an industry-strength RDBMS like MySQL.

CS 432 Networks and Data Communications

Required of CE, CS, and MIS majors, elective for EE and ME majors

Prerequisite: Computer Programming

Ashesi Units: 1; Credit Hours: 4; Hours per week classroom: 3; Hours per week lab: 1.5

Hours of Study outside of the class (reading, assignments, studying, projects, and so on: 9 per week)

This course introduces students to the fundamental concepts of computer networks and data communications, with practical applications; students will be able to recognize the components, relevance, advantages, and disadvantages of networking computers. Students will be introduced to the principles of data communications and transmission. Protocols employed in layers 1 to 3 will be examined in depth. Layer 4 protocols will be highlighted and compared to layer 2. Methods and mechanisms for constructing distributed computing systems and network services are discussed in the context of common Internet systems such as electronic mail, print and file servers and Web services. Hands-on exercises are used to help reinforce the fundamental concepts learnt. Labs will cover typical network operations tasks. Students will review hardware used in practice, common topologies and set up services on typical enterprise networks.

Course Objectives:

- 1. After successful completion of this course, students will be able to:
- 2. Understand and appreciate data communication and networking principles.

 Build a moderately sized computer network; for example, to implement local area networks (LANs)
- 3. Set up and administer network services and to analyze wide area networks (WANs)

CS 435 Operating Systems

Required of CE, CS, and MIS majors; elective for EE majors

Prerequisite: Computer Programming and Digital Systems Design

Ashesi Units: 1; Credit Hours: 4; Hours per week classroom: 3; Hours per week lab: 1.5

Hours of Study outside of the class (reading, assignments, studying, projects, and so on: 9 per week)

Operating Systems are fundamental to the operation of modern computer systems. This course will help students understand the role the OS plays and the many algorithms, protocols, mechanisms, and policies it employs in accomplishing its role. The course is both theoretical and practical. Students will be expected to understand important key concepts when it comes to the OS. They will also be expected to write programs that demonstrate understanding of key aspects in the course.

Course Objectives:

- To provide students a good understanding of the important role the OS plays in Computing system.
- To provide students an understanding of the algorithms, protocols, mechanisms, and policies that the OS uses in accomplishing its role.
- To build upon students' problem-solving skills through thinking about and implementing complex OS algorithms, protocols, mechanisms, and policies.
- To prepare students for graduate courses in OS.
- To help students see how OS concepts come into play in the world of Cloud Computing
- To help students see how OS concepts come into play in the world of Cloud Computing and Containerization

CS 456 Algorithm Design & Analysis

Prerequisite: Computer Programming for CS or Computer Programming for Engineering; Discrete Structures and Theory or Data Structures and Algorithms

Ashesi Units: 1; Credit Hours: 4; Hours per week classroom: 3; Hours per week lab: 1.5

Hours of Study outside of the class (reading, assignments, studying, projects, and so on: 6 - 9 per week)

Algorithm design is fundamental to Computer Science, and powerful algorithms are at the heart of most of the electronic tools we use every day, from Facebook to Google Maps, to airline scheduling systems. This course focuses on learning fundamental principles of algorithm design and analyzing the time and space complexity of algorithms. We will cover algorithm design strategies such as brute-force, greedy, divide-and-conquer, recursive backtracking, dynamic programming, and heuristic strategies. We will also introduce the concept of NP completeness and tractability. This course trains you to apply powerful problem-solving techniques to the complex problems you will encounter in your career as a computer scientist.

Course Objectives:

At the end of this course, students will be able to:

- Describe various algorithm design strategies (brute-force, greedy, divide-and-conquer, recursive backtracking, dynamic programming, heuristic, etc.), and identify practical example problems to which each of them would apply.
- Solve appropriate problems using each of the algorithm design strategies to be examined.
- Solve appropriate problems using fundamental graph algorithms.
- Analyze the runtime of non-recursive and recursive algorithms, expressing the runtime using asymptomatic notation.
- For a given problem, evaluate candidate algorithms, select from the range of possible options, provide

CS 353 Introduction to AI Robotics

Prerequisite: Computer Programming for CS or Computer Programming for Engineering; Discrete Structures and Theory or Data Structures and Algorithms

Ashesi Units: 1; Credit Hours: 4; Hours per week classroom: 3; Hours per week lab: 1.5

Hours of Study outside of the class (reading, assignments, studying, projects, and so on: 6 - 9 per week)

This course gives a theoretical as well as practical hands-on introduction to AI robotics as a field that integrates expertise in Computer Science, Engineering, Design and Mathematics to create innovative systems that interact with and can operate autonomously or semi-autonomously in the physical world.

Course Objective:

- To understand and be able to explain the foundational principles underlying the field of robotics
- To be able to integrate sensors, actuators, and software into a robot designed to undertake some task
- To be able to implement algorithms for planning and other functionality on robots
- To be able to read and understand robotics research papers
- To be able to give presentations on robotics work to technical and non-technical audiences

CS 413 Concepts of Programming Languages

This course examines fundamentals concepts in programming languages and major tools and techniques to implement them. The key characteristics of major programming paradigms, including the imperative programming paradigm and the functioning programming paradigm, will be studied and compared. Topics covered include specification and informal semantic models; binding and scoping; types and type systems; control structures; data abstraction; procedural abstraction and parameter passing; higher-order functions; and memory management. Programming assignments will give students the opportunity to master the course concepts.

Course Objectives:

To understand the issues, design, implementation and use of various programming languages a student must

- Understand some of the main issues and histories of some programming languages
- Appreciate various programming language domains, evaluation criteria, categories and trade-offs
- Understand the concepts of syntax and semantics
- Know lexical and syntax analysis as well as various algorithms used in parsing a language
- Be able to use a few languages that are functional, logical, interpreted, and compiled

CS 453 Robotics

Elective for CE, EE, ME, CS, and MIS majors

Prerequisite: Computer Programming and Calculus I

Ashesi Units: 1; Credit Hours: 4; Hours per week classroom: 3; Hours per week lab: 1.5

Hours of Study outside of the class (reading, assignments, studying, projects, and so on: 9 per week)

This course gives a practical hands-on as well as theoretical introduction to robotics as a field that integrates expertise in Computer Science, Engineering, Design and Mathematics to create innovative systems that interact with and can operate autonomously or semi-autonomously in the physical world. In this course, students will work individually and in groups to implement robotics projects using robotics platforms such as the Lego Mindstorms and EV3 kits, and the TurtleBot robot, as well as other electronic and mechanical components. Through these projects, they will learn how to build and write programs for an autonomous physical device that interacts with its environment. They will also learn to read and understand robotics research papers, to give presentations to technical and non-technical audiences, and follow a project from an initial idea through design to implementation and testing.

Topics: Historical overview of robotics, mobile robots and manipulators, kinematics of differential drive robotics, basic kinematics of manipulators, locomotion, sensing and perception, vision, control, motion planning, task planning, control architectures, advanced/special topics such as multi-robot coordination, robot learning.

CS 458 Internet of Things

Elective for CE, EE, ME, CS, and MIS majors

Prerequisite: none

Ashesi Units: 1; Credit Hours: 4; Hours per week classroom: 3; Hours per week lab: 1.5

Hours of Study outside of the class (reading, assignments, studying, projects, and so on: 9 per week)

The Internet of Things (IoT) course takes an end-to-end view of IoT including the devices, networks, data analytics, programming, security, and business. It exposes the student to all aspects of a functional IoT system and how to design a secure, robust and scalable IoT network, taking on a hands-on approach.

Labs and small projects will be used to gain understanding of key concepts at the various layers. Key among these are the devices, network protocols, data and programming aspects. Students will review hardware types and software tools and be introduced to IoT design principles which cover how to transition from an IoT idea to an IoT product, building prototypes and commercializing them.

Since IoT is still emerging, businesses are going to be either adopting IoT solutions or transforming their existing businesses to include IoT in a seamless and sustainable manner. The course addresses these aspects as well, in order to prepare participants to lead in this budding industry in the business segment.

Humanities and Social Sciences and Liberal Arts Core

AS 111 Ashesi Success

Required for All Freshmen Prerequisite(s): None

Typically offered in Semester Two Course Type: Seminar, Experiential

Credit Hours: 3; Ashesi Credit Units: 0; Hours per week classroom: 3; Hours per week discussion: 0

A program designed to enhance your overall success in college and in life. The most important objective of the program is personal empowerment: learning who you are as a college student, learning who you are as a human being and what you stand for, learning how to speak up when your values are in conflict with those around you, and learning what it takes for you to keep yourself balanced and on course to success. When you are empowered, your actions are more purposeful and your choices more deliberate. When you are empowered, you are more engaged and more motivated every day. And when you are empowered, you have a greater sense of well-being and enjoyment in life.

Standard Kalangu Modules

FYE Entrepreneurship Universe

Required for All Freshman Prerequisite(s): None

Typically offered in Semester One Course Type: Online Asynchronous

This is an introductory course for students to gain an overview of entrepreneurship as a concept and worthy economic endeavour for sustainable development. Using an asynchronous summit approach the module delivers engaging interactive lessons to guide students on an exciting journey of understanding entrepreneurship and its history and connecting the dots in relevant domains of entrepreneurship as deemed relevant.

FYE Quantitative Estimation and Data Visualization

Required for All Freshman Prerequisite(s): None

Typically offered in Semester One Course Type: Online Asynchronous

This course will give students skills and experience gathering reliable sources of data and bringing facts to bare on an issue that is important to them. Student will present their findings as a compelling numbers story—with accurately stated numbers, compelling supporting text, and insightful visual elements.

ENGL 001 Writing, Public Speaking, and Multimedia Communications

Required for All Freshman Prerequisite(s): None

Typically offered in Semester One Course Type: Online Asynchronous

This module is designed to equip learners with effective communication, research, and analysis skills that will prepare them for further development of these skills during their undergraduate studies and beyond. Students will be taught to refine their skills in the following areas: writing, public speaking, argumentation, multimedia communication, and research.

FYE Information Technology

Required for All Freshman

Prerequisite(s): None

Typically offered in Semester One Course Type: Online Asynchronous

This course will establish basic information technology literacy, information systems and how they are used in business, including hands-on use of computer applications, principles of digital computers and the internet, data communications and problem-solving through programming in Python.

FYE Principles of Design

Required for All Freshman Prerequisite(s): None

Typically offered in Semester One Course Type: Online Asynchronous

In this course, students will be introduced to key concepts and frameworks of design through a combination of readings, case studies, and videos. When harnessed, these tools will enable students to craft business ideas, build technical solutions, and systematically work through open-ended course projects. Teardowns of existing innovations are used for students to discover design methodologies employed in real-world examples.

FYE Creative Approaches to African Development (CAAD)

Required for All Freshman Prerequisite(s): None

Typically offered in Semester One Course Type: Online Asynchronous

This module is the capstone experience for all users that culminates the lessons learned from courses such as entrepreneurship universe, principles of design, quantitative estimation, information technology, and communication. The module enables students to use their critical thinking skills to analyze, deconstruct, and understand complex problems within their local and global communities through identified AU Goals. Students will work to understand how they can best design solutions relative to their communities. Ultimately developing the next big idea.

Kalangu Bridge Modules

FYE 002 English Bridge

Required for All Freshman Prerequisite(s): None

Typically offered in Semester One Course Type: Online Asynchronous

The course explores some conventions of written communication in English. Intended to facilitate the transition from High-school written communication to Undergraduate communication. The course discusses themes related to English language usage such as Parts of Speech, Verb quality, Modifier placement, and Parallel structures. An inquiry into thesis statements and the structure of

the academic essay provides a compelling simulation and introduction to Undergraduate written communication. Built into its asynchronous design, the gamified quizzes and workshop-style assessment strategies provide students with a variety of options to reflect on, workshop, and practice insights gained from the lessons. By the end of the course, students will come to appreciate some basic rules regarding written communication and undergraduate academic writing.

FYE Math Bridge

Required for All Freshman

Prerequisite(s): None

Typically offered in Semester One Course Type: Online Asynchronous

In this module, participants will reconnect and build on their existing mathematical experience and learn how to use that experience to solve real-life problems in Africa. This math module uses your previous mathematical experience to identify and describe numbers, trends, and patterns expressed in Africanized real-life scenarios relating to algebra, functions, data, and graphs. The Math bridge aims to develop ideas, improve quantitative reasoning, and merge gaps in the mathematical skills gained from previous schools. Participants will gain experience in understanding some basic practical concepts in mathematics coupled with rich African-related problems and Ashesi learning outcomes. Also, some strategies and skills developed in this module could be integrated and applied in futuristic mathematics courses and other modules.

FYE Math Bridge for Engineering

Required for All Freshman Prerequisite(s): None

Typically offered in Semester One Course Type: Online Asynchronous

This module shall introduce participants to the required fundamental knowledge to take up advanced engineering courses at the tertiary level. Some of the fundamental concepts to be discussed are Linear Equations, Polynomials, Logarithms and Trigonometry in the African context. Despite the content looking traditional, its delivery is highly focused on relating the concepts to practical African scenarios for a better understanding of how mathematical principles are formulated.

Humanities & Social Sciences Liberal Arts Core

ENGL 112 Written and Oral Communication

Required for all BA, MIS & CS, ENG Majors

Prerequisite(s): None

Typically offered in Semester Two

Course Type: Lecture

Credit Hours: 4; Ashesi Units: 1; Hours per week classroom: 3; Hours per week discussion: 1

Hours of Study outside of the class (reading, assignments, studying, projects, and so on: 8 per week)

This course offers an introduction to the practices of reading and writing for general university studies. Students will develop academic writing and analytical skills through critical reading, group discussion and various writing assignments. Strong emphasis will be placed on revising, with weekly workshops to clarify assignments and expectations and/or receive recommendations and feedback on works in progress.

ENGL 113 Text and Meaning

Required for all MIS & CS, ENG Majors

Prerequisite(s): Written & Oral Communication

Typically offered in Semester Two

Course Type: Lecture

Ashesi Units: 1; Credit Hours: 4; Hours per week classroom: 3; Hours per week discussion: 1

Hours of Study outside of the class (reading, assignments, studying, projects, and so on: 8 per week)

Text and Meaning takes a fresh approach to the study of literary and critical theory, integrating critical thinking into activities to increase students' very ability to learn and question. It is designed to teach students critical thinking skills, how to pose questions, propose hypotheses, gather and analyze data, and make arguments. To accomplish this, the term 'text' is used in its broadest possible sense, and includes literature, newspapers, magazines, speeches, advertising, websites, blogs, film, music and documentaries. Put simply, Text and Meaning

encourages students to do their own intellectual fishing, instead of waiting to be served.

SOAN 325 Research Methods

Required for all BA, MIS & CS Majors

Prerequisite: Statistics, or Statistics for Engineering & Economics

Typically offered in Semester Two

Course Type: Lecture

Credit Hours: 4; Ashesi Credit Units: 1; Hours per week classroom: 3; Hours per week discussion: 1 Hours of Study outside of the class (reading, assignments, studying, projects, and so on: 8 per week)

The course is designed to provide the student with broad fundamentals of research methods. To this end, students will be introduced to quantitative, qualitative and mixed methods approaches for conducting research. Students will be guided through the various stages of conducting research; i.e. writing research proposals, where they will identify problems to study; collecting information by conducting appropriate literature review; collecting appropriate primary and/or secondary data; analyzing data; writing mini reports; and critiquing published articles. Class time will be devoted to lectures, data analysis and in-class assignments. The course is hands-on, using R as the main software.

Leadership Seminar Series

The Leadership Seminar Series is a series of interdisciplinary seminars designed to promote self-awareness among Ashesi's students and to expose them to the ideas of great historical thinkers and contemporary leaders. Students will be asked to think broadly and to explore how they might use the examples set by other leaders to achieve their goals in their future professional lives. The leadership seminar series draws upon experts in different fields of corporate, social and academic life. Students must complete the full series in order to graduate from Ashesi University. The series consists of the following seminars:

SOAN 111 Leadership Seminar 1

Required for all BA, MIS & CS, ENG Majors

Prerequisite(s): Ashesi Success; Written and Oral Communication

Typically offered in Semester Two

Course Type: Seminar

Ashesi Units: 0.5; Credit Hours: 2; Hours per week classroom: 1.5; Hours per week discussion: 0 Hours of Study outside of the class (reading, assignments, studying, projects, and so on: 3 per week)

This course explores such questions as "What is good leadership? "What are the attributes of a Great Leader? and "What does a good leader do or not do? In this seminar, students will do readings of various historical and contemporary public and business leaders and explore the ethical dimensions of leadership. This is a half unit seminar taught in the format of discussions and assigned readings.

Course content addresses the purpose of leadership and the qualities of a great leader. Students will explore ethics and civic engagement in course readings and discussions. By comparing frameworks for leadership and ethical decision-making and applying those frameworks to leaders in a variety of contexts, students learn to analyze and evaluate the leadership they observe around them. Weekly writing assignments build students' skills in reflective writing. In-class discussions and debate build students verbal communication and presentation skills.

SOAN 211 Leadership Seminar 2

Required for all BA, MIS & CS, ENG Majors Prerequisite(s): Leadership Seminar 1 Typically offered in Semester One

Course Type: Seminar

Ashesi Units: 0.5; Credit Hours: 2; Hours per week classroom: 1.5; Hours per week discussion: 0 Hours of Study outside of the class (reading, assignments, studying, projects, and so on: 3 per week)

This seminar probes the most fundamental questions about the good society: "What are the most fundamental

rights of humanity? "What impact does national government have on the trajectory of nations? "What is the Social Contract - Rule of Law, and what impact does it have on civilizations?

After taking this seminar, students should have a deeper understanding of constitutional law and the concept of nations, whose leaders are expected to be servants of the people. This seminar also expands on the discussion of ethics, from corporate social responsibility to ethical issues in public office. Students will develop their skills in writing analytical and reflective papers.

SOAN 311 Leadership Seminar 3

Required for all BA, MIS & CS, ENG Majors Prerequisite(s): Leadership Seminar 2 Typically offered in Semester Two

Course Type: Seminar

Ashesi Units: 0.5; Credit Hours: 2; Hours per week classroom: 1.5; Hours per week discussion: 0 Hours of Study outside of the class (reading, assignments, studying, projects, and so on: 3 per week)

Leadership III seeks to challenge reflective thinking on what constitutes a "good society" and how best economic activity could be organized to realize it. How do we best achieve a balance of liberty, efficiency, equality, and community? At the end of this seminar series, students should have a better understanding of the interplay between natural and civic rights on the one hand and sustainable economic activity on the other. The aim is not to achieve consensus among participants as much as to get students to appreciate the tensions among various elements of the good society and why even within a predominantly capitalist democratic society, people may disagree and pursue differing philosophies.

The Leadership III module builds on the foundations of Leadership I and II by focusing on the issues pertaining to the economic organisation of the good society from the perspective of leadership as an inclusive, participatory, and ethical process of change-making in society.

This course provides students with an opportunity to engage and explore classic texts in economics, political economy, and development to understand and familiarise themselves with the various theoretical and philosophical arguments and concepts in the field of development and leadership while forming their own views and positions on economic matters. Moreover, the course allows the students to apply the philosophical arguments of selected texts to explore current global Sustainable Development Goals (SDGs) by using current data and resources to analyse socio-economic issues in the world with special reference to African nations.

SOAN 411 Leadership Seminar 4

Required for all BA, MIS & CS, ENG Majors Prerequisite(s): Leadership Seminar III

Typically offered in Semester One and Semester Two

Course Type: Seminar

Ashesi Units: 1; Credit Hours: 4; Hours per week classroom: 3; Hours per week discussion: 1

Hours of Study outside of the class (reading, assignments, studying, projects, and so on: 8 per week)

This course is a capstone to the Leadership Seminar Series and puts into practice many of the general concepts discussed in the previous leadership seminars and other courses taken at Ashesi. Service-learning, a vital component of the course, is intended to help you develop a sense of citizenship by becoming engaged with your surrounding community, putting the lessons learned throughout your leadership journey in the various seminars into practical use.

Servant leadership is the core concept we will explore in this course. You will have opportunities to reflect on the concept in different ways, including assigned readings and class discussions, debates, identifying and finding solutions to a service project in a community of your choice, various reflective assignments, team, and individual presentations, flip classrooms, shared readings, journaling, and guest speakers. This course is a full-unit capstone, it's not meant to be a 'cerebral' course. It's supposed to tug at your heart primarily; therefore, reading ahead of

class is crucial.

Africana/African Studies Elective Courses

ENGL 215 African Literature

Non-major elective

Prerequisite(s): Written and Oral Communication

Typically offered in alternate years

Course Type: Lecture

Ashesi Units: 1; Credit Hours: 4; Hours per week classroom: 3; Hours per week discussion: 1

Hours of Study outside of the class (reading, assignments, studying, projects, and so on: 8 per week)

African Literature, as a broad conceptual category, covers a broad array of discourses flung across the continent's various sub-cultures and its multiple language heritages. Given that wide and far-reaching background, we shall set ourselves a modest and researchable goal for the semester: we shall imagine the course as a survey course meant to offer a formal introduction to African literature in its broadest historical and cultural contexts. We shall interrogate some popular debates within African literary discourse (colonialism and cultural imperialism; the possibility of an "African" literature in non-African but Europhone languages; cultural nationalism and the independent nation-state; and gender, sexuality and African cultural traditions) and also invoke the peculiar historical, socio-cultural and cultural contexts that inform our selected texts.

ENGL 231 African Literature & Film

Non-major elective

Prerequisite(s): Written & Oral Communication, Text & Meaning

Typically offered in Semester One

Course Type: Lecture

Credit Hours: 4; Ashesi Credit Units: 1; Hours per week classroom: 3; Hours per week discussion: 1 Hours of Study outside of the class (reading, assignments, studying, projects, and so on: 8 per week)

This course aims to introduce students to some of the major debates in the subjects of African Literature and Film. Through an interdisciplinary approach, we will study African cultural creations in both mediums and others subtending or related to them, supplemented with short theoretical readings centered on the following interconnected topics: decolonization, gender, language and storytelling.

We will cover a range of themes, issues and debates, including but not limited to the following: the continent's engagement with Western thought and literary traditions, explore traditional oral literatures, examine commonalities in style and theme and tackle issues of gender and ethnicity. We will also examine literary works as complex expressions of their contexts, as well as indicators or an index of the values and worldviews of the societies in which they were composed from which they emerged, and those they came to subsequently enter.

The class is delivered through a variety of means, employing various techniques. Through class discussions, writing assignments and individual research, students will be able to combine, integrate and ultimately contribute to the sum of knowledge learned in this class with knowledge and skills gained in other courses, notably Written & Oral Communication and Text & Meaning.

POLS 221 African Philosophical Thought

Non-major elective

Prerequisite(s): Written & Oral Communication, Text & Meaning

Typically offered in Semester One

Course Type: Lecture

Ashesi Units: 1; Credit Hours: 4; Hours per week classroom: 3; Hours per week discussion: 1

Hours of Study outside of the class (reading, assignments, studying, projects, and so on: 8 per week)

A serious thinking through or reflection on the practical/tangible aspects of the human experience is the goal of philosophy. This course is an introduction to a variety of themes of philosophical thinking in Africa. The approach

adopted to advance the goals of the course, differs from traditional philosophy courses in a significant way. Specifically, we will read about the works of African philosophers; apply/interrogate such thoughts in such works to grounded cultural practices in actual and mediated lives; and think through and dialogue with fellow colleagues on the readings in this class. Thus, needless to say, throughout the course we will use concrete examples to ground readings which may sometimes be abstract. The goal of this grounded approach is to demonstrate the relevance of philosophical thinking in contemporary times and also to negate the idea that 'philosophy' does not 'touch ground' (that is, it is only intellectual exercise) and is thus only a 'thinking' (and boring) subject.

POLS 231 Africa in International Settings: Africa Beyond Aid

Non-major elective

Prerequisite(s): Written & Oral Communication, Text & Meaning

Typically offered in Semester One and Semester Two

Course Type: Lecture

Ashesi Units: 1; Credit Hours: 4; Hours per week classroom: 3; Hours per week discussion: 1

Hours of Study outside of the class (reading, assignments, studying, projects, and so on: 8 per week)

Across the African continent many want to do away with decades of aid dependency striving instead for a more assertive Africa on the international scene. This course encourages informed debate and a varied assessment of what overseas development assistance has evolved into over the years and how can it be complemented and replaced by more effective and relevant resources. It will offer a variety of case studies from individual African countries as well as identifying regional trends and characteristics.

The course aims to locate the topical 'Beyond Aid' debate in a theoretical, historical and regional perspective. It offers an introduction to main tenets of development theory and provides an overview of how international norms guiding development policy have evolved from the first development decade of the 1960s to the Sustainable Development Goals (SDGs) adopted by the UN in 2015.

Furthermore, the course assesses the changing role of development assistance in the context of African economic and social development and will compare contemporary data on the role of aid relative to trade, remittances and foreign direct investments. It will look at challenges confronting African countries aiming to offer a more diverse and varied understanding of development options and constraints relative to the often-stereotyped perceptions of 'one size fits all' presumably meant to apply across 54 very different nations on the continent. And it will look at how access to financial resources influence the position of African governments in shaping current geopolitical alliances.

POLS 332 Governance in Africa

Non-major elective

Prerequisite(s): Written & Oral Communication, Text & Meaning

Typically offered in Semester Two

Course Type: Lecture

Ashesi Units: 1; Credit Hours: 4; Hours per week classroom: 3; Hours per week discussion: 1

Hours of Study outside of the class (reading, assignments, studying, projects, and so on: 8 per week)

What are the big ideas, essential questions, disciplinary ways of thinking, and/or approaches to problem solving that students will engage with in the course? Why are they relevant?

In social theory as well as public policy the concept of 'governance' is often associated with normative prefixes: good governance, effective governance, sound governance etc. Likewise, governance may often be perceived as acts performed primarily by governments.

This course will aim to unpack governance from the 'embrace' of being a government prerogative and rather consider governance as institutional processes involving multiple actors inside and outside of government who endeavor to arrive at effective rules of the game for authoritative decision-making.

Rather than promoting a normative scheme, the course will suggest that governance must be considered as decisively shaped by the country and societal context. It offers a pragmatic approach to what can be considered

'best fit' given the circumstances rather than ideal notions of 'best practice'.

Such an approach offers analytical tools and enhanced awareness of how existing governance arrangements affect available opportunities and by what means institutional frameworks can be adjusted and made more responsive to needs of citizens, enterprises, and the wider society. The course offers a balance between global and international ideas and theories on governance on the one hand and on the other hand specific case studies from the African region, thereby aiming to verify and qualify generic statements on the nature of politics in Africa.

SOAN 220 African Aesthetics Values

Non-major elective

Prerequisite(s): Written & Oral Communication, Text & Meaning

Typically offered in alternate years Course Type: Lecture, Experiential

Ashesi Units: 1; Credit Hours: 4; Hours per week classroom: 3; Hours per week discussion: 1

Hours of Study outside of the class (reading, assignments, studying, projects, and so on: 8 per week)

It entails various aspects of African culture including music, dance, language, religion, cosmology and symbolism. Usually, teaching this course in the summer makes use of both ontological and epistemological approaches with loads of photos, videos and practical demonstrations.

SOAN 225 Ghanaian Popular Culture

Non-major elective

Prerequisite(s): Written & Oral Communication, Text & Meaning

Typically offered in Semester Two

Course Type: Lecture

Ashesi Units: 1; Credit Hours: 4; Hours per week classroom: 3; Hours per week discussion: 1

Hours of Study outside of the class (reading, assignments, studying, projects, and so on: 8 per week)

This Ghanaian Popular Culture course is an undergraduate, 300-level, African Studies elective at Ashesi University. The course uses creative and engaging content in Ghanaian Popular Culture (for instance, video movies, vehicle inscriptions, political cartoons) as a channel for teaching disciplinary analytical thinking and reasoning skills to focus on academic writing, and to indirectly prepare students for capstone projects.

SOAN 233 African Music and the Contemporary Art Music Scene

Non-major elective

Prerequisite(s): Written & Oral Communication, Text & Meaning

Typically offered in Semester Two Course Type: Lecture, Experiential

Ashesi Units: 1; Credit Hours: 4; Hours per week classroom: 3; Hours per week discussion: 1

Hours of Study outside of the class (reading, assignments, studying, projects, and so on: 8 per week)

This course explores the role of music and dance as essential components of life within African traditions. It introduces students to the basic elements of African life as connected to music and dance. It will extend to include some aspects of contemporary African music and dance. The course exposes students to the connection between music and dance and their role as repositories of African indigenous knowledge, values and virtues. Students will be given skills to conceptually and practically explore the socio-historical and cultural contexts of the African life through examination of specific music and dance types. It will be delivered through lectures, workshops, practical observations and demonstrations.

SOAN 322: African Cultural Institutions

Non-major elective

Prerequisite(s): Written & Oral Communication, Text & Meaning

Typically offered in Semester Two

Course Type: Lecture

Credit Hours: 4; Ashesi Credit Units: 1; Hours per week classroom: 3; Hours per week discussion: 1 Hours of Study outside of the class (reading, assignments, studying, projects, and so on: 8 per week)

Contemporary African societies reflect the interplay of tradition and change. The institutions of the past have not simply given way to the newer ones of the present. It is an interplay among what Ali A. Mazrui called a "Triple Heritage" of Indigenous Africa, Islamic Africa, and Euro-Christian/Western Africa. Kwame Nkrumah identified the same dynamic and described it as "Consciencism"—how these three influences on contemporary African life and institutions generate a "crisis of conscience". Thus, African cultural institutions and practices continue to give direction to the internal and external changes that are taking place in Africa and in the Americas today. This course examines the social, political, economic and religious institutions embodying patterns of culture that have evolved over thousands of years and represent Africa's contribution to global civilization. The course enables students to see Africa in a global perspective and provides a framework for scholarly reflection. We approach this course from socio-anthropological perspectives and identify culture as:

- A lived experience developed over time with contours and detours based on geography, history and environment,
- African cultures as different yet similar to all other cultures

The course focuses on three interrelated themes: (a) Cultural processes and institutions that existed just prior to the "arrival" of Europeans, (b) the raptures to these cultural processes and institutions—caused especially by the trans-Atlantic slave trade and its subsequent colonial phase, and (c) the legacies of these ruptures during the postcolonial era to the present. Of particular concern will be the effect on processes of development and democratization. The integration and/or influences of African cultural institutions with other parts of the world, and the centrality of "Africa" in the world receive attention.

SOAN 227 Religion in Africa

Non-major elective

Prerequisite(s): Written & Oral Communication, Text & Meaning

Typically offered in Semester Two

Course Type: Lecture

Ashesi Units: 1; Credit Hours: 4; Hours per week classroom: 3; Hours per week discussion: 1

Hours of Study outside of the class (reading, assignments, studying, projects, and so on: 8 per week)

This course is an introduction to a cross-cultural study of religions and cultures of Africa through the disciplines of anthropology, history, and sociology of religion. The goal of the course is to teach students to think critically about the traditional religious heritage of Africa as a profound reflection on the human condition. This goal is achieved through a systematic study of the attitudes of mind, beliefs, as well as practices which have evolved in the many African societies such as the Akan of Ghana, Yoruba and Ibo of Nigeria, Malinke of Guinea, the Ewe/Fon of Dahomey/Benin, the Luo of Tanzania, K(G)ikuyu and Masai of Kenya, the Zulu of Southern Africa, and the Mende of Sierra Leone. Through the viewing of documentary films, movies, lectures, and discussions, the meaning, structure, nature, and world views of contemporary Africans are closely examined.

In addition, the course offers an overview of how cultural and religious knowledge is generated, understood, and used as Africans in general and Sub-Saharan Africans in particular, draw on their music and dance, myths, art forms and symbols to articulate and elaborate on the cosmos, life, sickness, health, and death, as they organize their lives. It does so by retrieving and analyzing the significance of creation myths, religious personalities such as rulers, diviners, and healers, in relation to the role of the ancestors.

Finally, it reflects on the social, cultural and historical factors which have engendered religious changes in Africa. Particularly it unpacks the problematic emergence of two world religions, Christianity and Islam—"Guest Religions"—and their encounters with the indigenous religions of Africa. Attention is paid to the impact is the "host" on the "guest" religions. In the end, it is hoped that students are enabled to interpret, articulate and synthesize religious knowledge, experience, and reflection as they deal with African ideas, belief systems and practices.

SOAN 301 Introduction to Africana Studies: The Global Black Experience

Non-major elective

Prerequisite(s): Written & Oral Communication, Text & Meaning

Typically offered in Semester One and Semester Two

Course Type: Lecture

Ashesi Units: 1; Credit Hours: 4; Hours per week classroom: 3; Hours per week discussion: 1

Hours of Study outside of the class (reading, assignments, studying, projects, and so on: 8 per week)

Introduction to Africana Studies surveys the sum-total of the content of Black peoples' lives historically and in the present. The course raises and attempts to answer some key questions: What is the nature and historical contours of the Global Black Experience? How have our understandings and appreciations of this experience changed over time? What is "Africa" to (a) Continental Africans? (b) Caribbean/South American Africans? (c) North American Africans and (d) Indian (Asia) Africans—such as the Sidi of Mumbai? The term "Africana" therefore encapsulates the "wide community" of Africa. It offers an openly conceptual framework to attract new and emerging ways of understanding the global Black experience.

The course therefore explores the interconnectedness of Black subject identities, experiences, issues, themes, as well as topics, and applies them dynamically to <u>diverse locations</u> of the Black world. Specifically, it sheds light on the global approach to the African Diaspora, showing how globalism underscores the distinctive role that Africa and African people have played in their contributions to world affairs. It seeks to demonstrate how Africana people have reclaimed their own "story", noting that "until lions have their own historians, tales of hunting will always glorify the hunter."

Thus, the methodology of this course uses a paradigm which identifies the multiple levels of Black reality over time. The basic facts and perspectives of the course come from the synthesis of three main sources: Africana intellectual tradition, the traditional academic disciplines (particularly the humanities and social sciences), and the Black Studies Movement. The course is also concerned with the development of academic skills. Through lectures, discussions, documentary and feature films, students are guided to learn how to read and interpret the scholarly output of the field of Africana Studies, master key concepts, definitions and terminologies. In addition, students learn to express their understandings and reactions to the subject matter both verbally (oral presentations) and in writing in the mode associated with the discipline of Africana Studies.

SOAN 235 Embodied African Aesthetic Foundations: West African Traditional and Contemporary Dance Praxis

Non-major elective

Prerequisite(s): Written & Oral Communication, Text & Meaning

Typically offered in Semester Two

Course Type: Experiential

Ashesi Units: 1; Credit Hours: 4; Hours per week classroom: 3; Hours per week discussion: 1

Hours of Study outside of the class (reading, assignments, studying, projects, and so on: 8 per week)

This course will be a mix of movement labs and lecture conversations. Even through Zoom, movement concepts and aesthetics are translated, explored and deepened in our bodies. We practice dance strengthening and conditioning to prepare our bodies for West African Dance techniques. Innovative collaboration between student research projects is created in the course. Research projects are interdisciplinary, integrating student' Majors, Minors, and/or specific inquiries as they interconnect with African aesthetic foundations, principles, and the embodied knowledge of West African Traditional and Contemporary dance and culture. Everyone is welcome. All abilities have taken this course over the years and find research extending into West African Dance to be eye opening, meaningful, and a space for new knowledge production as well as deep identity exploration.

POLS 322 China-Africa Relations

Non-major elective

Prerequisite(s): Written & Oral Communication, Text & Meaning

Typically offered in Semester Two

Course Type: Lecture

Ashesi Units: 1; Credit Hours: 4; Hours per week classroom: 3; Hours per week discussion: 1

Hours of Study outside of the class (reading, assignments, studying, projects, and so on: 8 per week)

The period from the 1990s has witnessed rapidly bourgeoning Sino-Africa ties, even though ties between them are not new. This is an interdisciplinary course intended to study the historical, economic, cultural, military, and political relations between the People's Republic of China and independent Africa. Employing a miscellany of primary source documents and secondary sources, the course will explore these interactions between China and Africa. We shall be particularly interested in a number of pertinent questions, including, does present-day Chinese engagement in Africa amount to a "new scramble for Africa" or "neo-imperialism"? Is China a hegemonic power in Africa? What are the implications of the "Beijing Consensus", and how has China's embrace of market reform in the 1980s changed her economic and ideological ties with Africa? This course also investigates the nascent role of Chinese companies and businesses in a fast-developing Africa. The goal is to augment students' comprehension of the dynamics of China-Africa relations in a progressively globalized world.

POLS 234 Comparative Politics: Politics in Africa

Non-major elective

Prerequisite(s): Written & Oral Communication, Text & Meaning

Typically offered in Semester Two

Course Type: Lecture

Credit Hours: 4; Ashesi Credit Units: 1; Hours per week classroom: 3; Hours per week discussion: 1 Hours of Study outside of the class (reading, assignments, studying, projects, and so on: 8 per week)

This course is designed to study theoretically and empirically contemporary Politics of Africa. It is a study of African states and their domestic politics, laying emphasis on state-society interactions, governance, governing ideologies, forms of social (ethnic) and political pluralism, monopolization of political and economic power, popular resistance to power, connections, disruptions, and fractures from global politics, chronic underdevelopment and political repression of citizens, the rise of active polities, and the uses and abuses of cultural ties amid dynamism and pervasive violence. In fine, we shall interrogate the processes, institutions, ambiguities, antinomies and contradictions of African politics. The course also involves a study of the many theoretical and epistemological approaches developed to address the issues of African politics.

French Elective Courses

FRENC 111 Introductory French 1

Non-major elective Prerequisite(s): None

Typically offered in Semester One and Semester Two

Course Type: Lecture

Ashesi Units: 1; Credit Hours: 4; Hours per week classroom: 3; Hours per week discussion: 1

Hours of Study outside of the class (reading, assignments, studying, projects, and so on: 8 per week)

The economic development being experienced by Ghana and the geographical location of the country (surrounded by francophone countries), its trade relations with its neighboring francophone countries, makes both the French language a fundamental means of communication in Ghana, especially in business and at all levels of business transactions. To be competent and competitive in the region, companies have understood that to be able to communicate, both in French and English is a plus, and that there is therefore a need to have bilingually trained staff.

In response to this need, Ashesi University has decided to offer its students, training in French, which will enable them to become « independent users » of French which means that they can easily survive in a francophone environment. The objective is to bring them to attain a level B1 or B2 of the CEFR (Common European Framework of Reference for Languages).

The Common European Framework divides learners into three broad divisions that can be divided into six levels: A1, A2, B1, B2, C1 & C2. For each level, it describes what a learner should be able to do in reading, listening, speaking and writing. We want our students who are taking the Introduction to French 1 class to get to meet the

requirements of level A1.

FRENC 122 Professional French 1

Non-major elective

Prerequisite(s): Introductory French 2 or three years of JHS school French. (**Francophone are not allowed to take this course as it is a French as a Foreign Language course**)

Typically offered in Semester Two

Offered: Fall

Course Type: Lecture

Ashesi Units: 1; Credit Hours: 4; Hours per week classroom: 3; Hours per week discussion: 1

Hours of Study outside of the class (reading, assignments, studying, projects, and so on: 8 per week)

FRENC 315 Francophone Literature, Films and Creative Writing

Non-major elective

Prerequisite(s): Professional French 2 or a DELF B1 or a test in French. (Francophones are allowed to take this course)

Typically offered in alternate years

Course Type: Lecture

Credit Hours: 4; Ashesi Credit Units: 1; Hours per week classroom: 3; Hours per week discussion: 1 Hours of Study outside of the class (reading, assignments, studying, projects, and so on: 8 per week)

This course introduces students to African literature written in French with emphasis on the work of major authors from West Africa and other authors parts of the Negritude movement. The study of diverse literary genres (Tales, epic, novel, short story, poetry, essay) will be supported by insights into the respective geographical, historical, linguistic, and societal context such as the triangular trade, the colonial era in Africa and the Negritude (Movement) School and its impact on African Literature.

In this course students will read and analyze books and books' extracts, watch and debate about films and documentaries for the period starting in 1940's and going up to the present. Through all those documents students will also learn about the Francophonie, the African francophone culture. Creative writing and writing with constrains will help students to improve their general and academic writing in French.

The course is an "Africana course" and will allow them to become more confident of their communication skills in French whether it is reading, writing, understanding or speaking.

This course is taught in French and is open for francophone students and/ or students who are advance users of

French (at least a B1 level).

FRENC226 French Media and Communication

Non-major elective

Prerequisite(s): Introductory French 2 or French around the world of fashion, DELF A2

Have an intermediate level in French (A2 level on the CECR grid here under)

Typically offered in alternate years

Course Type: Lecture

Credit Hours: 4; Ashesi Credit Units: 1; Hours per week classroom: 3; Hours per week discussion: 1 Hours of Study outside of the class (reading, assignments, studying, projects, and so on: 8 per week)

The focus of this course will be on the development of fluency and spontaneity of oral and written expression through radio animation. Student will have close interaction with various aspects of modern African francophone culture and during synchronous class discussions, students will be given the opportunity to formulate their opinions about current points of controversy in West Africa and report back on their online researches, while weekly written assignments (essays, synopsis, conductors, scripts) will help students improve their writing skills and prepare their final project: a 30 minutes radio program. For this course, students will surround themselves with aspects of everyday francophone west African culture: media (newspapers, radio, TV) pop culture (cinema, art festivals, music), and literature in order to simulate, as much as possible, complete immersion with oral and written comprehension.

We will also help students to take into account that today's media industry expands beyond traditional print (newspaper) and broadcast (Television and Radio) but also includes blogs, vlogs and social networking. As the most successful people in today's media are, whether they are doing media as a hobby, an engagement or professionally our students will not only get some skills in writing and speech, but they will also become excellent online and offline communicators and problem solvers. They will become innovative and entrepreneurial, bold and curios, open-minded and collaborative. By taking this course students will also gain a critical understanding of the media industry while acquiring technical and professional skills in French communication, information design and using them in the Ashesi Radio and beyond.

ECTS per Department

Course Catalog for joint MAS and MSc Mechatronics Engineering Programs

List of courses to be taken for graduation:

1. Advanced Fundamentals [MAS]

- o Mathematical Tools I
- o Mathematical Tools II
- o Thermofluids
- o Computer Programming / Embedded Systems
- Analog and Digital Electronics
- Material Engineering
- Signals and Systems
- o Dynamics
- Statics and Solid Mechanics
- Computational Methods

2. Mechatronics [MSc]

- Control Systems I
- o Control Systems II and Optimal Control
- o Introduction to Robotics and Mechatronics
- System Identification and Modelling
- Advanced Communication Systems and Internet of Things
- o Data Analysis and Machine Learning

3. Engineering in Perspective [MSc]

- o Finance and Policy Making for Technology Innovation
- Leading Teams
- o Corporate Responsibility and Sustainability
- o Reducing the Environmental Footprint of Society
- Introduction to Development Economics
- Sustainable Engineering

4. Energy Systems [MSc]

- Energy Systems I
- Energy Systems and Mobility

5. Production [MSc]

- Manufacturing Processes
- o Process Engineering
- Product Development
- Reliability and Risk

MAS Curriculum (Year I)

Mathematical Tools I

This course covers mathematical concepts and techniques necessary to model, solve and discuss scientific problems - notably through ordinary differential equations. The key is the so-called mathematical modelling cycle, i.e. the translation of problems from outside of mathematics into mathematics, the study of the mathematical problems and the interpretation of the results in the original environment. The content will span from single-variable calculus and linear algebra to ordinary differential equations.

Mathematical Tools II

This course is continuation of Mathematical Tools I and the main focus is on multivariable calculus and partial differential equations. The goal of Mathematics II is to provide the mathematical foundations relevant for this paradigm. Differential equations are by far the most important tool for modelling and are therefore a main focus of the course.

Thermofluids

This course introduces to the fundamentals of thermodynamics and fluid dynamics. In particular, it introduces the 1st and 2nd law of thermodynamics, the concept of energy, properties of compressible substances, and the kinetic theory of gases.

Embedded Systems and Computer Programming

An embedded system is some combination of computer hardware and software, either fixed in capability or programmable, that is designed for a specific function or for specific functions within a larger system. The course covers theoretical and practical aspects of embedded system design and includes a series of lab sessions. The focus of this lecture is on the design of embedded systems using formal models and methods as well as computer-based synthesis methods.

Digital Electronics

The course provides basic knowledge and methods to understand and to design digital circuits and systems. The content of the course includes digital and analogue signals and their representation, boolean algebra, circuit analysis and synthesis, the MOS transistor, CMOS logic, static and dynamic behaviour, tristate logic, Karnough-Maps, hazards, binary number systems, and coding. Moreover, will be also covered combinational and sequential circuits and systems (boolean algebra, K-maps, etc.), memory building blocks and memory structures, programmable logic circuits, finite state machines, and architecture of microprocessors.

Material Engineering

This module provides fundamental training in the behavior and manufacturing properties of materials as well as an introduction to materials selection and design considerations as practiced in industry, including related concepts such as Design for Manufacturing and "green" design. The objectives of the course include, the understanding of the societal implications of materials development, the appreciation of the challenges in materials selection, following the economical aspect of process selection, and grasp that any material is much more than its chemical composition.

Signals and Systems

Signals arise in most engineering applications. They contain information about the behavior of physical systems. Systems respond to signals and produce other signals. In this course, we explore how signals can be represented and manipulated, and their effects on systems. We further explore how we can discover basic system properties by exciting a system with various types of signals. The course will cover discrete-time signals and systems, Fourierand z-Transforms, frequency domain characterization of signals and systems, system identification, time series analysis, and filter design.

Dynamics

This course aims at providing a graduate level introduction into the identification and condition assessment of

structural systems. Upon completion of the course, the students will be able to: Test Structural Systems for assessing their condition, as this is expressed through stiffness, analyse sensor signals for identifying characteristic structural properties, such as frequencies, mode shapes and damping, based on noisy or incomplete measurements of the structural response, Establish relationships governing structural response (e.g. dynamics equations), Identify possible damage into the structure by picking up statistical changes in the structural "signature" (behavior).

Statics and Solid Mechanics

The course revisits the basic concepts of forces and mechanical power, and introduces methods for the analysis of statics problems: distributed forces, center of gravity, equilibrium, principle of virtual power, trusses, frames, forces and moments in beams and cables, friction. For the mechanical design of deformable bodies, the concepts of stress and deformations and introduced, thus allowing the formulation of the basic problem of continuum mechanics. Different constitutive models are discussed, including anisotropic linear elasticity, linear viscoelasticity, plasticity, viscoplasticity. The course will cover basic structural theories and their applications for the analysis of structural stability and fatigue problems.

Computational Methods

This module introduces numerical methods and techniques for solving initial boundary value problems in solid mechanics (heat conduction, static and dynamic mechanics problems of solids and structures), finite difference methods, indirect and direct techniques, variational methods, finite element (FE) method, FE analysis in small strains for applications in structural mechanics and solid mechanics.

MSc Curriculum: Semester-by-semester structure/schedule of course

Semester	Course Code	Module	Credit Hours (TPC)
Year 1			
	MECH 581	Analysis and Design of Control Systems	(2,2,3)
	MECH 521	Data Analysis and Machine Learning	(2,2,3)
Sem. 1:	MECH 501	Leading Teams*	(2,0,2)
Sep - Jan	MECH 531	Energy Systems	(2,2,3)
	MECH 503	Corporate Responsibility & Sustainability*	(2,0,2)
	MECH 511	Reliability and Risk	(2,2,3)
		Semester 1 total credit	16
	MECH 582	Optimal Control	(2,2,3)
	MECH 584	Robotics	(1,2,2)
	MECH 586	Mechatronics	(1,2,2)
Sem. 2:	MECH 502	Reducing Societal and Environmental Footprint*	(2,0,2)
Jan - May	MECH 532	Energy Systems and Mobility	(2,2,3)
	MECH 542	Process Engineering	(2,2,3)
	MECH 504	Finance and Policy for Technology Innovation*	(2,0,2)
		Semester 2 total credit	17
Year 2			
	MECH 681	System Identification and Modelling	(2,2,3)
		Electives: (1 of these)	
	MECH 611	Sustainable Engineering	(2,2,3)
	MECH 613	Process Improvement & Optimization	
		Electives: (1 of these)	
	MECH 631	Advanced Communication Systems and Internet of Things	(2,2,3)
	MECH 633	Automation and Production Systems	
Sem. 1:	MECH 601	Development Economics	(2,0,2)
Sep - Jan			
	MECH 613	Electives: (1 of these)	
	MECH 651	Product Development	(2,2,3)
		Machine Tools (Jigs, Fixtures and Tools) Design	
		Electives: (1 of these)	
	MECH 641	Manufacturing Processes	(2,2,3)
	MECH 645	Food Production Technology	
		Semester 1 subtotal	17
Sem. 2:		Internship	4
Jan - May	Master Thesis	6	
		Total Program Credit	60

Course Descriptions of Mechatronics Engineering Programs

Course Description:

Provide short description of the content of the courses in the programme to include:

MECH 581 Analysis and Design of Control Systems (2,2,3)

a. Objective

The students will learn how to analyse systems and synthetize controllers for linear time invariant systems with one input and one output signal.

b. Content

Modelling and linearization of dynamic systems with single input and output signals; State-space description; Analysis (stability, reachability, observability, etc.) of open-loop systems; Laplace transformation; Systems analysis in the frequency domain; Transfer functions and analysis of the influence of its poles and zeros on the system's dynamic behaviour. Frequency response; Analysis of closed-loop systems using the Nyquist criterion; Formulation of performance constraints; Specification of closed-loop system behaviour; Synthesis of elementary closed-loop control systems; Proportional-Integral-Derivative (PID) controllers; Lead/lag compensation; Loop shaping; Discrete time state space representation and stability analysis

MECH 582 Optimal Control (2,2,3)

a. Objective

This course focuses on the theory and practice of advanced control techniques like state feedback, linear multi-variable control systems, and model predictive control.

b. Content

Extension of the basic SISO ideas (time and frequency domain, controllability, observability, eigenvalues, poles, zeros, frequency response, etc.) to MIMO systems; Design of state feedback controllers in time domain; Pole allocation; Finite-horizon LQR; Infinite-horizon LQR; Design of state observers and observer-based controllers with state feedback; LQG approaches; Invariance; Nominal Model Predictive Control; Tracking Model Predictive Control; Stability and robustness analysis of Model Predictive Control; Robust Model Predictive Control

MECH 584 Robotics (1,2,2)

a. Objective

This to introduce the fundamentals of robotic systems including kinematics and dynamics as applied to manipulators and mobile robots.

b. Content

 Manipulators; Kinematics; Actuators, sensors and simple sensor processing algorithm; Trajectory planning; Motion control; Teleoperation, Master-slave systems - Supervisory control - Latency problems. Vision Systems; Path Planning

MECH 586 Mechatronics (1,2,2)

a. Objective

By the end of the course, the students will be able to independently choose, design and integrate these different building blocks into a working mechatronic system.

b. Content

Over the course, the lecture topics will include an overview of

Robotics in the mechatronics context; An introduction to different types of sensors and their use;
 Data acquisition; Microcontrollers programming; Interfacing embedded computers with the real world; Digital signal filtering; Digital signal processing; Introduction to different types of actuators and their use; An overview of computer vision; Forward and inverse kinematics in mechatronics

MECH 681 System Identification and Modelling(2,2,3)

a. Objective

Learn how to mathematically describe a physical system or a process in the form of a model usable for analysis and control purposes.

b. Content

• Introduction to system modelling for control. First principles modelling; Lagrangian modelling; Energy-based methods. Model parametrization; Parameter estimation; Data fitting and statistics; Least-squares estimation; Frequency-domain identification; Time-domain identification; Prediction error methods; ARX Models; Closed-loop identification

MECH 631 Advanced Communication Systems and Internet of Things (2,2,3)

a. Objective

The objective of this course is to provide an understanding of the principles for transport technologies for modern communications networks and architectures as well as the internet of things.

b. Content

The course will cover:

• protocol layers (both computing & IoT environment); delay, loss, throughput; routing algorithms; ethernet, switching, link layer; LANs, Constrained node networks; Internet protocol, Forwarding, Internet routing, routing policies, BGP challenges and solutions; TCP protocol; DNS, HTTP, IPv6; FieldBus, Modbus, Profibus, Profinet, Powerlink Ethernet, CANOpen; Constrained devices; Communications channels as adapted for IoT including 802.15.4 variants, (Zigbee, 6LoWPAN, WirelessHart, etc) NB-IoT, Bluetooth, Cellular, PLC, VLC et; Protocols suited for IoT:; Technologies for IoT: IoT sensors, MCU, communication modules, database technologies, data mining technologies and hosting, visualization; Programming for IoT Data Collection and Communication; Industrial Internet of Things protocols; IoT Security

MECH 521 Data Analysis and Machine Learning (2,2,3)

a. Objective

The course will introduce the foundations of learning and making predictions from data. We will discuss important machine learning algorithms used in practice, and provide hands-on experience in a course project.

b. Content

The course will cover:

• Linear regression; Overfitting; Cross-validation/bootstrap; Model selection; Regularization; [Stochastic] gradient descent; Linear classification; Logistic regression; Feature selection; Sparsity; Multi-class classification; Kernels and the kernel trick; Properties of kernels and applications to linear and logistic regression; K-nearest neighbour; Neural networks; Backpropagation; Regularization; Convolutional neural networks; Unsupervised learning; K-means; PCA; Neural network autoencoders; The statistical perspective (regularization as prior; loss as likelihood; learning as MAP inference); Statistical decision theory (decision making based on statistical models and utility functions); Discriminative vs. generative modelling (benefits and challenges in modelling joint vs conditional distributions); Bayes' classifiers (Naive Bayes, Gaussian Bayes; MLE); Bayesian approaches to unsupervised learning (Gaussian mixtures, EM).

MECH 504 Finance and Public Policy for Engineers (2,0,2)

a. Objective

This course will provide engineering students with basic knowledge on finance and public policy related to technology and innovation. It will have a particular focus on developing country-specific finance and policy aspects.

b. Content

Evaluation and financing of capital projects. Methods taught include investment appraisal; cost
effectiveness analysis, cost benefit analysis; technological forecasting, expert elicitation; cash
flows for a project; time value of money; evaluation criteria for investment decisions, taxation;
sensitivity, scenario and other decision analysis techniques; risk and return, sources of finance for
projects, etc. Hands-on case studies, in which the students take an investor's or policy maker's
role.

MECH 501 Leading Teams (2,0,2)

a. Objective

This course will provide an understanding of the basic HRM functions and their relationship to leadership, and how to manage team processes and diversity

b. Content

• The policies, practices, and systems that influence employees' behaviour, attitudes, and performance. Practical instruments supporting leadership functions; basic HRM functions and their relationship to leadership; instruments for selection, performance appraisal, compensation, management, and personnel development (from team leader's perspective); leadership requirements and success factors in leadership; fundamental processes in teams; how to manage team processes and diversity; Fundamentals of effective leadership and dynamics in teams. semester projects to apply HRM instruments in company contexts.

MECH 611 Sustainable Engineering (2,2,3)

a. Objective

Students will learn a holistic approach of sustainable development. Ecological, economic and social constraints will be presented and students will learn about methods for argumentation and tools for assessment) that influence our built environment. An objective is to address current challenges of climate change mitigation and resource depletion.

b. Content

The following topics give an overview of the themes that are to be worked on during the lecture:

history and emergence of sustainable development; current understanding and definition of sustainable development. the role of cities, urbanisation and material resources (i.e. energy, construction material) in social economic and environmental sustainability; role of stakeholders, their motivations and constraints; how to evaluate challenges, identify deficits and define strategies to promote a more sustainable construction. Method 1: Life cycle assessment (planning, construction, operation/use, deconstruction). Method 2: Life Cycle Costing. Method 3: Labels and certification. Operation energy at building, urban and national scale, mobility and density questions, and embodied energy for developing and developed world. theory and application of current scientific pathways towards sustainable development.

MECH 601 Development Economics (2,0,2)

a. Objective

The goal of this course is to provide students with a basic understanding of both theories and empirics on poverty, growth and inequality. Based on this understanding, important policies for sustainable economic development and poverty reduction are discussed, with a focus on the role of technological innovations.

b. Content

How development can be defined and measured – building on Sen's capability approach. Classical
and endogenous growth theory and the role of capital, technological innovation, governance,
education and health for economic development. How various forms of market failures lead to
environmental destruction and extreme poverty and the policies that are needed by a state to
confront it. The role of globalization for the future development of countries in sub-Saharan Africa
will be discussed.

MECH 502 Reducing Societal and Environmental Footprint(2,0,2)

a. Objective

The objectives of this course are to (1) gain an overview of relevant questions in the area of international environmental politics from a social sciences viewpoint; (2) learn how to identify interesting/innovative questions concerning this policy area and how to answer them in a methodologically sophisticated way; (3) gain an overview of important global and regional environmental problems and how they could be solved.

b. Content

This course deals with how and why international cooperation in environmental politics emerges, and under what circumstances such cooperation is effective and efficient. Based on theories of international political economy and theories of government regulation various examples of international environmental politics to be discussed include:

• the management of international water resources; political responses to global warming; the protection of the stratospheric ozone layer; the reduction of long-range transboundary air pollution; protection of biodiversity; how to deal with plastic waste; the prevention of pollution of the oceans, etc.

MECH 503 Corporate Responsibility & Sustainability (2,0,2)

a. Objective

This course introduces approaches to corporate social responsibility. It will address questions such as - What is the responsibility of companies to contribute to society, if any? How can companies integrate their responsibility into the business model and along the supply chain?

b. Content

The course will cover international soft-laws or self-regulation instruments, and discuss the challenges companies face when implementing corporate social responsibility in business operations.

MECH 531 Energy Systems (2,2,3)

a. Objective

Students learn the potential and limitations of renewable energy technologies and their contribution towards sustainable energy utilization.

b. Content

Engineering aspects of energy conversion for

solar thermal, solar photovoltaics, biomass, wind, geothermal, hydro, and waste-to-energy technologies. Technologies for energy optimization

MECH 532 Energy Systems and Mobility (2,2,3)

a. Objective

This course provides and introduction to current and future propulsion systems behaviour, focussing on energy generation and utilisation. It addresses electrical aspects of energy engineering and topics in renewable energy. Moreover, it will also cover system optimization and controller design for vehicles.

b. Content

Physical description and mathematical models of components and subsystems; Power utilization;
 Power electronics; Propulsion; load control; supercharging, emissions; drive train components; HV &

LV power distribution

MECH 641 Manufacturing Processes (2,2,3)

a. Objective

The course discusses fundamental terms of production engineering and process chain planning.

b. Content

Basic principles of manufacturing techniques; functionality of a manufacturing shop. Plastic
deformation- and separative- manufacturing processes; laser machining (welding and cutting), and
their layouts, product defining properties; limitations of applications such as the associated workshop
facilities; principles of the industrial measurement technique; mechatronics concepts in machine tool
construction; quality assurance,

MECH 542 Process Engineering (2,2,3)

a. Objective

Students should be able to evaluate and design biological, chemical (or similar) processes, and develop simple mathematical models to simulate the processes.

b. Content

 biological and chemical processes used (eg in wastewater treatment, organic waste management, and biological resource recovery. Also an overview of other common industrial processes. Fundamental principles of biological and chemical processes; process design based on kinetic and stoichiometric principles, e.g., anaerobic digestion for biogas production and aerobic wastewater treatment. Process technologies, equipment and systems; Industrial Processes; Process Technology operations; Quality, Safety, Health and Environment

MECH 613 Product Development (2,2,3)

a. Objective

The course introduces students to the product development process. Students will in a team, explore the early phases of conceptual development and product design, from ideation and concept generation through to hands-on prototyping.

b. Content

 Introduction to product development and engineering design; product planning and social-economictechnology (SET) factors; user-centred design and product specification; concept generation and selection methods; system design and embodiment design; hands-on prototyping and prototype planning; material selection in engineering design; product lifecycle and sustainability; design for manufacture and design for additive manufacture.

MECH 511 Reliability and Risk(2,2,3)

a. Objective

Students will be able to model complex technical systems and critical infrastructures including their dependencies and interdependencies with appropriate numerical methods. At the end, they will be able to propose design improvements and protection/mitigation strategies to reduce risks and vulnerabilities of these systems.

b. Content

Preamble: Modern technical systems and critical infrastructures are complex, highly integrated and interdependent. Examples of these are highly integrated energy supply, energy supply with high penetrations of renewable energy sources, communication, transport, and other physically networked critical infrastructures that provide vital social services. As a result, standard risk-assessment tools are insufficient in evaluating the levels of vulnerability, reliability, and risk. This course offers suitable

Analytical models and computational methods to evaluate levels of vulnerability, reliability, and
risk with scientific accuracy. Introduction to complex technical systems and critical infrastructures;
basics of the Markov approach to system modelling for reliability and availability analysis; Monte
Carlo simulation for reliability and availability analysis, Markov Chain Monte Carlo for applications
to reliability and availability analysis, dependent, common cause and cascading failures; complex
network theory for the vulnerability analysis of complex technical systems and critical
infrastructures; basic concepts of uncertainty and sensitivity analysis in support of the analysis of
the reliability and risk of complex systems under incomplete knowledge of their behaviour.
